I. INTRODUCTION

[1] The next great wave of Internet-enabled innovation has arrived, and it is poised to revolutionize the way humans interact with the world around them. This paper highlights some of the opportunities presented by the rise of the so-called Internet of Things (IoT) in general and wearable technology in particular and encourages policymakers to allow these technologies to develop in a relatively unabated fashion.

[2] Wearable technologies are networked devices that can collect data, track activities, and customize experiences to users' needs and desires. These technologies are a subset of IoT, which comprises networked "smart devices" equipped with microchips, sensors, and wireless communications capabilities.¹ Wearable technologies are among the

* Senior Research Fellow, Mercatus Center at George Mason University. Portions of this paper have been adapted from Adam Thierer, *Permissionless Innovation: The Continuing Case for Comprehensive Technological Freedom* (2014). The author thanks the following individuals for their helpful comments on various drafts of this paper: Robert Graboyes, Jerry Brito, Dan Caprio, Ryan Hagemann, Will Rinehart, Ryan Radia, and two anonymous reviewers.

¹ See Charles McLellan, *M2M and the Internet of Things: A Guide*, ZDNET (Jan. 10, 2013, 1:27 PM), <http://www.zdnet.com/m2m-and-the-internet-of-things-7000008219>, archived at <http://perma.cc/XNK7-GJEY>.

fastest-growing segment of IoT and promise to have widespread societal influences in the coming years.²

[3] As with other new and highly disruptive digital technologies, however, IoT and wearable technology will challenge existing social, economic, and legal norms. In particular, these technologies raise a variety of privacy and safety concerns. Other barriers exist that could hinder IoT and wearable technology—including disputes over technical standards, system interoperability, and access to adequate wireless spectrum to facilitate ubiquitous networking capabilities—but those issues will not be discussed in this paper.³ Some wearable technologies will raise safety concerns, but those issues will be only briefly addressed. The focus of this paper will be on the privacy and security concerns that are already prompting calls for policy interventions.⁴

[4] Some of the privacy and security concerns about IoT and wearable technologies are legitimate and deserve responses. But those responses should not be top down or command and control in nature. Privacy and security are important values worthy of attention, but so too are

² See, e.g., David Evans, *The Future of Wearable Technology: Smaller, Cheaper, Faster, and Truly Personal Computing*, LINKEDIN (Oct. 24, 2013), <http://www.linkedin.com/today/post/article/20131024145405-122323-the-future-of-wearable-technology-smaller-cheaper-faster-and-truly-personal-computing>, archived at <http://perma.cc/GL2Y-9MMS> (addressing various new wearable technologies and their likely impacts on society).

³ See, e.g., Bob Violino, *The Internet of Things Gets Real*, NETWORK WORLD (June 2, 2014, 6:00 AM), <http://www.networkworld.com/news/2014/060214-internet-of-things-281935.html?hpg1=bn>, archived at <http://perma.cc/DC4S-YDEE> (quoting Daniel Castro, Director of the Information Technology and Innovation Foundation's Center for Data Innovation in Washington, saying that “[a] big issue is standards and interoperability” and that “[b]uilding the IoT will require massive amounts of cooperation and coordination between firms.”).

⁴ See, e.g., Amadou Diallo, *Do Smart Devices Need Regulation? FTC Examines Internet Of Things*, FORBES (Nov. 23, 2013, 9:01 AM), <http://www.forbes.com/sites/amadoudiallo/2013/11/23/ftc-regulation-internet-of-things/>, archived at <http://perma.cc/K772-7HSY>.

innovation, entrepreneurialism, economic growth, price competition, and consumer choice. Regulation—especially regulation of fast-moving, rapidly evolving technologies—is likely to be premature and overly rigid and is unlikely to allow the many beneficial uses of these technologies.⁵ Such constraints would be highly unfortunate because these technologies “will have profound implications for addressing important social and economic issues.”⁶

[5] Therefore, generally speaking and barring clear evidence of direct risk to health or property—not merely hypothetical or ephemeral fears—policymakers should not impose prophylactic restrictions on the use of new wearable technologies and IoT. The default position toward these technologies should be “innovation allowed” or “permissionless innovation.”⁷ The burden of proof rests on those who favor precautionary regulation; they must explain why ongoing experimentation with IoT technologies should be prevented preemptively by force of law.⁸

[6] The better alternative to top-down regulation is to deal with concerns creatively as they develop, using a combination of educational

⁵ See Daniel F. Spulber, *Unlocking Technology: Antitrust and Innovation*, 4 J. COMPETITION L. & ECON. 915, 965 (2008) (“Governments are notoriously inept at picking technology winners. Understanding technology requires extensive scientific and technical knowledge. Government agencies cannot expect to replicate or improve upon private sector knowledge. Technological innovation is uncertain by its very nature because it is based on scientific discoveries. The benefits of new technologies and the returns to commercial development also are uncertain.”).

⁶ Daniel Castro, *Internet of Things Meets Holiday Wish Lists*, INFORMATIONWEEK (Dec. 4, 2013, 10:56 AM), <http://www.informationweek.com/strategic-cio/executive-insights-and-innovation/internet-of-things-meets-holiday-wish-lists/d-d-id/1112901>, archived at <http://perma.cc/TK89-SBKH>.

⁷ ADAM THIERER, PERMISSIONLESS INNOVATION: THE CONTINUING CASE FOR COMPREHENSIVE TECHNOLOGICAL FREEDOM ix (2014) [hereinafter PERMISSIONLESS INNOVATION].

⁸ See *id.*

efforts, technological empowerment tools, social norms, public and watchdog pressure, industry best practices and self-regulation, transparency, and targeted enforcement of existing legal standards (especially torts), as needed.⁹ This bottom-up and layered approach to dealing with problems will not preemptively suffocate technological experimentation and innovation in these spaces. This paper will conclude by outlining those solutions.

[7] Finally, and perhaps most importantly, societal and individual adaptation will play a role here, just as it has during so many other turbulent technological transformations. Although formidable privacy and security challenges are ahead, individuals and institutions will adjust in an evolutionary, resilient fashion, just as they adjusted to earlier disruptive technologies.

II. THE GROWTH OF THE INTERNET OF THINGS AND WEARABLE TECHNOLOGY: APPLICATIONS AND OPPORTUNITIES

A. The Internet of Things Arrives

[8] Many of the underlying drivers of the Internet and Information Age revolution—massive increases in processing power,¹⁰ exploding storage capacity,¹¹ steady miniaturization of computing and cameras,¹²

⁹ *See id.*

¹⁰ *See* HAL ABELSON, KEN LEDEEN & HARRY LEWIS, BLOWN TO BITS: YOUR LIFE, LIBERTY, AND HAPPINESS AFTER THE DIGITAL EXPLOSION 8–9 (2008) (“The rapid increase in processing power means that inventions move out of labs and into consumer goods very quickly.”).

¹¹ *See, e.g.*, Sebastian Anthony, *How Big Is the Cloud?*, EXTREMETECH (May 23, 2012, 10:48 AM), <http://www.extremetech.com/computing/129183-how-big-is-the-cloud>, archived at <http://perma.cc/645K-KCH5>; Steve Lohr, *Data Explosion Lifts the Storage Market*, N.Y. TIMES (Sept. 9, 2011, 10:20 AM), http://bits.blogs.nytimes.com/2011/09/09/data-explosion-lifts-the-storage-market/?_r=0, archived at <http://perma.cc/SS2K-FL72>.

ubiquitous wireless communications and networking capabilities,¹³ digitization of all data,¹⁴ massive datasets (or “big data”¹⁵)—are beginning to have a profound influence beyond the confines of cyberspace.¹⁶ For example, it is cheaper than ever to integrate a microchip, a sensor, a camera, and even an accelerometer into devices today.¹⁷ “Thanks to

The technology for even less intrusive mechanisms, such as jewelry, buttons, and implants, exists and will ultimately find commercial applications.”). A database of many current wearable technologies can be found at <http://vandrigo.com/database>. See also Abigail Tracy, *How the Internet of Things Actually Works [Infographic]*, INC. (Mar. 25,

transitioning to what Alex Hawkinson, CEO and founder of SmartThings, calls a “programmable world” where “things will become intuitive [and] connectivity will extend even further, to the items we hold most dear, to those things that service the everyday needs of the members of the household, and beyond.”²²

[10] This so-called Internet of Things—or machine-to-machine connectivity and communications²³—promises to usher in “a third computing revolution”²⁴ and bring about profound changes that will rival the first wave of Internet innovation.²⁵ The first use of the term “Internet of Things” is attributed to Kevin Ashton, who used it in the title of a 1999 presentation.²⁶ A decade later, he reflected on the term and its meaning:

²⁶ Kevin Ashton, *That 'Internet of Things' Thing*, RFID JOURNAL (June 22, 2009), <http://www.rfidjournal.com/articles/pdf?4986>, *archived at* <http://perma.cc/CS6G-9DYW>.

If we had computers that knew everything there was to know about things—using data they gathered without any help from us—we would be able to track and count everything, and greatly reduce waste, loss, and cost. We would know when things needed replacing, repairing, or recalling and whether they were fresh or past their best.

We need to empower computers with their own means of gathering information, so they can see, hear, and smell the world for themselves, in all its random glory. RFID [radio-frequency identification] and sensor technology enable computers to observe, identify, and understand the world—without the limitations of human-entered data.²⁷

[11] More recently, analysts with Morrison Foerster have defined IoT as “the network of everyday physical objects which surround us and that are increasingly being embedded with technology to enable those objects to collect and transmit data about their use and surroundings.”²⁸ These low-power devices typically rely on sensor technologies²⁹ as well as

major role in traffic control, fighting forest fires, and landslide detection.”⁶⁴

[17] But that just scratches the surface of potential money-saving and life-saving applications for IoT technologies.⁶⁵ IoT technologies will produce benefits for firms and consumers.⁶⁶ Many of these benefits will come about only after data is collected and used for entirely new purposes.

[18] For firms, “IoT has great potential to generate new sources of revenue, improve efficiencies and allow businesses to both increase profits and cut costs.”⁶⁷ IoT will have many important applications for traditional manufacturing industries as well.⁶⁸ General Electric coined the term *Industrial Internet* to explain how “[t]he advent of networked machines with embedded sensors and advanced analytics tools” could revolutionize industrial machinery in coming years.⁶⁹ This “the fourth industrial

revolution”⁷⁰ could result in improved efficiencies and significant cost savings.⁷¹

[19] For consumers, IoT technologies will offer a staggering array of new devices and service options that will make their lives and jobs easier.⁷² That is especially the case with the subset of IoT technologies known as *wearables*, which will be discussed extensively throughout this paper.

B. The Expanding World of Wearables

[20] In its massive 2002 report titled *Converging Technologies for Improving Human Performance*, the U.S. National Science Foundation predicted that, within the next two decades, “[c]omfortable, wearable sensors and computers will enhance every person’s awareness of his or her health condition, environment, chemical pollutants, potential hazards, and information of interest about local businesses, natural resources, and the like.”⁷³ Thirteen years later, the future that the National Science Foundation predicted is starting to emerge.

[21] Although rudimentary wearable technologies—such as calculator wristwatches, hearing aids, and Bluetooth-enabled communications headsets—have been on the market for many years, this market is now expanding quite rapidly.⁷⁴ Even though “[w]earables are still looking for their killer app,”⁷⁵ health and fitness wearables are already widely used today.⁷⁶ Popular examples include the FitBit and Jawbone wearable fitness bracelets, which have been on the market for several years and command the bulk of market share.⁷⁷ The so-called quantified self movement refers to individuals who use such digital logging tools to continuously track their daily activity and well-being.⁷⁸ Many users share their data with others to compare results and provide “instant feedback,”⁷⁹

⁷⁹ Katrina Plyler, *What Is Everybody Wearing? Fitness Tech Gadgets!*, U.S. NEWS (Apr. 11, 2014, 8:00 AM), <http://health.usnews.com/health-news/blogs/eat->

for example, by notifying individuals about how many steps they have taken or buzzing (or even shocking them)⁸⁰ to remind them to be more active. Users of fitness bracelets often share results and compete for “step supremacy.”⁸¹

[22] As they grow more sophisticated, wearable health devices will help users track, and even diagnose various conditions, and potentially advise a course of action or, more simply, remind users to take medications or contact medical professionals as necessary.⁸² In the process, these health and fitness devices and applications could eventually become “lifestyle remotes” that help consumers control or automate many other systems around them, regardless of whether they are in their homes, offices, cars, or the like.⁸³ As a result, wearables will have even more uniquely personal properties and capabilities than the broader IoT, which will raise special privacy concerns discussed later in this paper.

[23] These wearable technologies are gaining more widespread public visibility and now even have their own product section on Amazon.com.⁸⁴

⁸³ Metz, *supra* note 75; DuBravac, *supra* note 29, at 7–8.

According to the research firm Canalys, there was a 700% growth in the market for wearable smart bands in the second half of 2013 over the first half.⁸⁵ IDC reports that “wearables took a huge step forward over the past year and shipment volumes will exceed 19 million units in 2014, more than tripling last year’s sales. From there, they predict that the global market will swell to 111.9 million units in 2018, resulting in a CAGR [compound annual growth rate] of 78.4%.”⁸⁶ “Hearables”, or small devices worn in the ear to provide users with relevant real-time information, are also expected to become a major part of the wearable market in coming years.⁸⁷ One wireless analyst estimates that such “smart earbuds” could constitute a \$5 billion market by 2018.⁸⁸

⁸⁴ See Hayley Tsukayama, *Wearable Tech Grows Enough to Get Its Own Section on Amazon*, WASH. POST (Apr. 29, 2014), <http://www.washingtonpost.com/blogs/the-switch/wp/2014/04/29/wearable-tech-grows-enough-to-get-its-own-section-on-amazon/>, archived at <http://perma.cc/Q56S-EXRH>.

[24] Major smartphone and tablet developers such as Apple⁸⁹ and Samsung⁹⁰ are also getting more active in this space, which will likely give these applications and services even greater visibility. Beyond their touch screens and wireless networking capabilities, modern smartphones include sensors, accelerometers, cameras, microphones, and other capabilities that can be used to collect and transmit various types of user information. At a summer 2014 conference for developers, Apple “unveiled plans to let people use their iPhones and iPads to control an array of Internet-connected devices in their homes, from door locks to lightbulbs.”⁹¹ Apple simultaneously launched “HealthKit,” which will “help apps, third party devices and healthcare services collect, quantify, and share your health data . . . [and] could change the way you track and manage your well-being.”⁹² Google promptly responded with a competing service called Google Fit.⁹³

resilient, which “means they can be fed into a loom or embroidered directly onto cloth that can be worn and washed as normal. With costs falling and use increasing, the threads are a rapidly growing business.”¹⁰⁴ Meanwhile, technology developers are working actively to make these wearable devices more fashionable.¹⁰⁵

[28] The medical monitoring capabilities associated with wearable technologies are particularly compelling. Eric Topol, author of *The Creative Destruction of Medicine: How the Digital Revolution Will Create Better Health Care*, predicts that in the coming years, we’ll see apps and adds that “will bring with it the ability to obtain measurements continuously, even during sleep and times of substantial stress, which, as you might expect, are periods that represent essential gaps in our ability to track things today.”¹⁰⁶

[29] Many elderly individuals are already using wearable technologies to ensure they can report medical emergencies to caregivers and family

Topol goes on to examine how technology and these apps can revolutionize monitoring blood glucose, diabetes, heart rhythms, vital signs, asthma attacks, sleep apnea, and mood disorders. See *id.* at 65–73.

members.¹⁰⁷ Medical Body Area Network (MBAN) sensors in professional health care are also set to take off. MBAN sensors “will enable patient monitoring information such as temperature to be collected automatically from a wearable thermometer sensor.”¹⁰⁸ South Korean scientists have already developed a flexible electronic skin patch “that’s thinner than a sheet of paper and can detect subtle tremors, release drugs stored inside nanoparticles on-demand, and record all of this activity for review later.”¹⁰⁹ Also, health technology provider MC10 has created Biostamp, a thin, bandage-like sensor patch that can be worn anywhere on the body to “monitor temperature, movement, heart rate, and more, and transmit this data wirelessly back to patients and their clinicians.”¹¹⁰

[30] Many other medical and health-related wearable applications that take advantage of the aforementioned smartphone and tablet capabilities are already on the market. Nathan Cortez of the Southern Methodist University School of Law has developed a six-part typology of mobile health applications, some of which potentially butt up against existing Food and Drug Administration (FDA) regulatory authority (table 1).¹¹¹ In

September 2013, the FDA issued draft guidance for mobile medical applications, which attempted to explain which mobile health apps qualified as regulated “medical devices” and which did not.¹¹² The agency noted that it “intends to apply its regulatory oversight to only those mobile apps that are medical devices and whose functionality could pose a risk to a patient’s safety if the mobile app were to not function as intended.”¹¹³ Legislation has also been floated that would clarify the FDA’s regulatory authority in this area.¹¹⁴ Meanwhile, health insurance providers are starting to experiment with wearables to offer customers more tailored plans and premiums, which will likely drive greater regulatory interest.¹¹⁵

Table 1. Typology of Mobile Health Technologies

<p>Connectors: applications that connect smartphones and tablets to FDA-regulated devices, thus amplifying the devices' functionalities.</p> <p>Replicators: applications that turn a smartphone or tablet itself into a medical device by replicating the functionality of an FDA-regulated device.</p> <p>Automators and customizers: apps that use questionnaires, algorithms, formulas, medical calculators, or other software parameters to aid clinical decisions.</p> <p>Informers and educators: medical reference texts and educational apps that primarily aim to inform and educate.</p> <p>Administrators: apps that automate office functions, like identifying appropriate insurance billing codes or scheduling patient appointments.</p> <p>Loggers and trackers: apps that allow users to log, record, and make decisions about their general health and wellness.</p>

[31] Beyond health and fitness applications, wearables can be used to enhance personal convenience. For example, wearables can be used in homes to tailor environmental experiences, such as automatically adjusting lighting, temperature, or entertainment options as users move from one space to another. Even if these technologies do not catch on as mass-market consumer products, wearable technology may come to be more widely used in a variety of business and organizations.¹¹⁶ Some of the more exciting potential professional uses of wearable technology include the following:

¹¹⁶ See, e.g., H. James Wilson, *Wearables in the Workplace*, HARV. BUS. REV., Sept. 2013, available at <http://hbr.org/2013/09/wearables-in-the-workplace/ar/1>, archived at <http://perma.cc/4BLQ-7MG4>; see also Claire Cain Miller, *At Google, Bid to Put Its Glasses to Work*, N.Y. TIMES, Apr. 7, 2014 at B1, available at http://www.nytimes.com/2014/04/08/technology/google-begins-a-push-to-take-glass-to-work.html?_r=0, archived at <http://perma.cc/J2Z7-WLLW>.

- **Surgery:** Surgeons are already using wearable technology to better perform complex procedures, and in the future, wearable technology might be able to help them do this remotely.¹¹⁷
- **Emergency care:** Ambulances can be equipped with various IoT devices to more quickly diagnose what ails patients and then provide immediate treatment in the precious minutes after accidents or other health emergencies.¹¹⁸
- **Firefighting:** In coming years, firefighters might use wearable technology to respond to fires and other emergencies more rapidly using heads-up displays to obtain instant readouts of building schematics or environmental conditions.¹¹⁹
- **Law enforcement:** Wearables could transform the field of law enforcement but also raise some surveillance concerns in the process. Importantly, however, average citizens will also be able to use wearable technologies to monitor the activities of those same law enforcement officials.¹²⁰ They will have the First

- **Political campaigning:** Politicians and “political professionals are eagerly exploring how [Google Glass] could become a powerful campaign tool” and how wearable technologies could help engage potential voters.¹²⁸
- **Sports:** Teams and athletes may use wearables not only to improve their own abilities but also to potentially give fans an additional ways to see how they practice or even play their games.¹²⁹

C. The Sci-Fi Future of Wearables: “Implantables,” “Ingestibles,” and “Biohacking”

[32] Wearable technologies will continue to evolve and could offer applications that might seem to have been ripped from the pages of science fiction novels.¹³⁰ For example, implantables, embeddables, and even ingestibles are already emerging as the next wave of wearable technology.¹³¹ These technologies are now worn somewhere on the body,

medical team.”¹⁴¹ It “is designed to reduce hospitalizations among patients with moderate heart failure by enabling physicians to identify problems and modify treatment before patients end up in the [emergency room].”¹⁴²

- Proteus Digital Health has created an ingestible sensor no bigger than a grain of sand that “it hopes will increase the effectiveness of existing medications by helping to ensure they’re taken as prescribed.”¹⁴³ Users would swallow the pill while administering other medications. After it is activated by stomach fluids, the pill transmits relevant information to a small disposable body patch as well as to the patient’s computing devices via a Bluetooth connection. That information can then be shared with medical professionals “to better understand how patients are responding to their treatments.”¹⁴⁴

[33] Importantly, many of these implantable and ingestible innovations will be driven not just by commercial vendors, but also by average citizens working together to enhance various human capabilities.¹⁴⁵ Amateur body hacking or “biohacking” efforts will likely grow more prevalent in coming years.¹⁴⁶ Collaborative forums where individuals can share information

and collaborate on various projects of this sort, such as Biohack.Me,¹⁴⁷ already exist.¹⁴⁸ Advocates of such amateur biohacking sometimes refer to themselves as “grinders,” which Ben Popper of *The Verge* defines as “homebrew biohackers [who are] obsessed with the idea of human enhancement [and] who are looking for new ways to put machines into their bodies.”¹⁴⁹

[34] As these technologies and capabilities advance, they will raise thorny ethical and legal issues. Ethically, they will raise questions of what it means to be human and the limits of what people should be allowed to do to their own bodies.¹⁵⁰ In the field of law, they will challenge existing health and safety regulations imposed by the FDA and other government agencies.

[35] However, efforts to restrict such activities could be complicated by both practical and legal factors. Practically speaking, if enough people are attempting to modify their bodies or enhance various human capabilities, it may become very difficult for the law to keep up. Also—in terms of the

law—because many of these activities will be of a voluntary, noncommercial nature, those producing and sharing information about biohacking activities will likely have First Amendment protection to do so, thereby making regulatory efforts even more challenging. Hence, regulators might have to focus on limiting the supply of materials and devices used by biohackers to achieve these goals. But those materials will likely fall in cost and expand in availability over time, especially with the rise of 3-D printing.¹⁵¹ The FDA held a public workshop on these issues in early October 2014.¹⁵²

[36] A more robust discussion of biohacking—and the various policy issues it might raise—is beyond the scope of this paper. The debate over wearable technologies, however, could foreshadow many of the same concerns and policy issues that will arise in these future debates. Moreover, some of the solutions that might emerge to deal with concerns about wearables might be useful when the debate over biohacking intensifies, which is why the issue has been discussed in this paper.

[37] At a minimum, these technologies will force a conversation about how much control people have over their bodies or at least about information regarding their bodies. “Studies show that more-engaged patients have lower costs and better health outcomes,” a recent *Wall Street Journal* report noted.¹⁵³ “Becoming familiar with one’s own health records can help patients better understand their own condition and have

more informed conversations with doctors.”¹⁵⁴ But it remains to be seen whether such innovations will be allowed or how they might be regulated.

III. WHICH POLICY VISION WILL GOVERN THE INTERNET OF THINGS AND WEARABLE TECHNOLOGY?

[38] Many IoT technologies will be overhyped and could eventually fail.¹⁵⁵ For example, Internet-enabled refrigerators get plenty of attention today, but “the reality is that the average consumer will replace his or her fridge no more than once per decade—and, most likely, not for improved functionality, just to keep the milk cold.”¹⁵⁶

[39] As they become more commonplace and fashionable,¹⁵⁷ however, many other IoT technologies will succeed, including technologies and applications that are unimaginable today—albeit in a sporadic,

¹⁵⁴ *Id.*

¹⁵⁷ See, e.g., ROSE, *supra* note 19, at 28 (“The adoption of wearable devices will be accelerated as technology blends with fashion.”).

unpredictable fashion.¹⁵⁸ Whether such technologies succeed or fail should be left to the interaction of inventors and consumers. What sort of policy regime will govern this fast-moving, constantly evolving space and help incentivize constantly expanding innovation and consumer choice? This paper will turn to that question next.

[40] Wearable technology, like IoT more generally, raises a wide variety of potential concerns, many of which relate to privacy and security.¹⁵⁹ These social and cultural concerns will be the primary focus of this paper. Economic concerns—including worries about job dislocations because of increasing automation¹⁶⁰—also will come up in discussions about some of these technologies, but they will not be the primary focus of this paper.

[41] Such concerns are leading to a replay of a debate that has already occurred many times in the modern information economy: the clash between the “permissionless innovation” and “precautionary principle” mindsets.¹⁶¹ A recent book published by the Mercatus Center discussed

¹⁵⁸ See DuBravac, *supra* note 29, at 8 (“While some of these things might seem far off, their foundations are already unfolding before us. We tend to think about linearly moving from point A to point B, but that is not the process through which tech adoption and innovation diffusion typically occur. These advancements—the little steps for man and the big steps for mankind—tend to occur through a series of hybrid periods.”).

¹⁵⁹ See, e.g., John Brandon, *Wearable Devices Pose Threats to Privacy and Security*, FOX NEWS (June 18, 2014), <http://www.foxnews.com/tech/2014/06/18/wearable-devices-pose-threats-to-privacy-and-security>, archived at <http://perma.cc/9JM8-NC6E>; see also Kashmir Hill, *The Half-Baked Security of Our ‘Internet of Things’*, FORBES (May 27, 2014, 2:56 PM), <http://www.forbes.com/sites/kashmirhill/2014/05/27/article-may-scare-you-away-from-internet-of-things>, archived at <http://perma.cc/2T42-VPP7>; Raj Samani, *The IoT Is Already Here: Will You Be Secure?*, INFORMATION SECURITY BUZZ (Feb. 27, 2014), <http://mcaf.ee/h2xom>, archived at <http://perma.cc/XRT3-JR7Y>.

¹⁶¹ PERMISSIONLESS INNOVATION, *supra* note 7.

the interplay between these two worldviews and the implications of this policy battle for the future of various emerging technologies.¹⁶² Each of these policy visions will be summarized below, and then their applicability to the debate over wearables and IoT will be discussed.

A. Permissionless Innovation vs. the Precautionary Principle

[42] Should the creators of new technologies seek the blessing of public officials before they develop and deploy their innovations? How people answer this question—which they might think of as “the permission question”—depends on the disposition they adopt toward new inventions.

[43] One policy disposition is known as the *precautionary principle*.¹⁶³ Generally speaking, it refers to the belief that new innovations should be curtailed or disallowed until their developers can prove that they will not cause any harms to individuals, groups, specific entities, cultural norms, or various existing laws, norms, or traditions.¹⁶⁴ Advocates believe policymakers should regulate new technology “early and often” to “get ahead of it” and address social and economic concerns preemptively.¹⁶⁵

[44] The other policy vision can be labeled *permissionless innovation*.¹⁶⁶ The term refers to the notion that experimentation with new technologies and business models should generally be permitted by default.¹⁶⁷ Unless a compelling case can be made that a new invention

¹⁶⁷ *See, e.g., id.*

will bring serious harm to individuals, innovation should be allowed to continue unabated, and problems—if they develop at all—can be addressed later.¹⁶⁸ Permissionless innovation is not an absolutist position that denies any role for government. Rather, it is an aspirational goal that stresses the benefit of pushing “innovation allowed” as the best default position to begin debates about technology policy.¹⁶⁹ The burden of proof is on those who favor preemptive, precautionary controls to explain why ongoing trial-and-error experimentation with new technologies or business models should be disallowed.

[45] The clash between these two visions is already evident in today’s policy discussions regarding wearable and IoT technologies. Again, some already worry about the security¹⁷⁰ and privacy implications of a world of wearable technology.¹⁷¹ Others worry about the overquantification of people’s lives¹⁷² or—more profoundly—that these technologies will turn people into robots¹⁷³ or “cyborgs.”¹⁷⁴

collect about users, how long will the data be retained, and who else might have access to that information?¹⁸⁵ The answers to these questions remain unclear at this point, but it is equally unclear what sort of beneficial uses and applications might flow from such technologies.¹⁸⁶ Those beneficial uses are often only discovered after a great deal of experimentation.

[48] Nonetheless, some policymakers, academics, and regulatory activists are calling for policy action on the potential privacy and security vulnerabilities associated with IoT and wearable technologies.¹⁸⁷ In a new paper titled “Regulating the Internet of Things,” University of Colorado Law School professor Scott R. Peppet says that mere potential for certain harms “suggests a need for urgency” on this front.¹⁸⁸ He continues,

Not only are consumers currently vulnerable to the discrimination, privacy, security and consent problems outlined here, but it may become harder over time to address such issues. In technological and political circles it may be convenient to prescribe a “wait and see—let the market evolve” stance, but the reality is that as time passes

¹⁸⁸ Peppet, *supra* note 4, at 71.

it will likely become harder, not easier, for consumer advocates, regulators, and legislators to act. The Internet of Things is here. It would be wise to respond as quickly as possible to its inherent challenges.¹⁸⁹

In other words, Peppet is suggesting that new innovation in this space should be preemptively curtailed, or at least tightly regulated, to ensure that none of these potential risks or harms develop. Again, this is precautionary principle thinking.

[49] Some lawmakers and regulators have endorsed that sort of precautionary approach as the basis of public policy toward IoT and wearable technologies. Federal Trade Commission (FTC) Chairwoman Edith Ramirez addressed these issues in a 2013 speech, “The Privacy Challenges of Big Data: A View from the Lifeguard’s Chair.”¹⁹⁰ Ramirez worried about the privacy and security concerns associated with “big data,” or the massive datasets of information made available through various modern digital sites and services.¹⁹¹ Ramirez claimed,

The indiscriminate collection of data violates the First Commandment of data hygiene: Thou shall not collect and hold onto personal information unnecessary to an identified purpose. Keeping data on the off chance that it might prove useful is not consistent with privacy best practices. And remember, not all data is created equally. Just as there is

low quality iron ore and coal, there is low quality, unreliable data. And old data is of little value.¹⁹²

Thus, she claimed, “information that is not collected in the first place can’t be misused,” and then she outlined a parade of “horribles” that will occur if such data collection is allowed at all.¹⁹³ She was particularly concerned that companies might use such data to discriminate against certain classes of customers.¹⁹⁴

[50] There are other concerns regarding data collection practices. Some legal scholars today decry what Ryan Calo of the University of Washington School of Law calls “digital market manipulation,” or the belief that “[f]irms will increasingly be able to trigger irrationality or vulnerability in consumers—leading to actual and perceived harms that challenge the limits of consumer protection law, but which regulators can scarcely ignore.”¹⁹⁵ Others fear “power asymmetries” between companies and consumers and even suggest that consumers’ apparent lack of concern about sharing information means that people may not be acting in their own best self-interest when it comes to online safety and digital privacy choices.¹⁹⁶ “[O]ne can imagine,” Calo suggests, “the government

fashioning a rule—perhaps inadvisable for other reasons—that limits the collection of information about consumers in order to reduce asymmetries of information.”¹⁹⁷

B. The Problem with Precautionary Principle–Based Policymaking

[51] So, what’s wrong with this sort of precautionary approach to policymaking? Doesn’t it make sense to plan ahead for worst-case scenarios, including those that might develop for IoT and wearable technologies? After all, these technologies clearly have the potential to disrupt well-established social and legal norms.

[52] Anticipating and seeking to avoid potential hazards are important parts of life, but there are problems with converting the logic of “better safe than sorry” from an informal personal or institutional prescription into a formal legal directive. When individuals and institutions apply anticipatory, precautionary thinking and policies in their own lives or business decisions, they bear the cost of those efforts. By contrast, when precautionary thinking is converted into preemptive policy prescriptions, the cost of those actions will be borne by a far greater universe of actors.

[53] Generally speaking, the problem with “precautionary” policymaking comes down to this: if people spend all their time living in constant fear of worst-case scenarios—and premising public policy on such fears—it means that best-case scenarios will never come about. “Wisdom [and progress] are born from experience, including experiences

regime, which is the heart of our political system. Individuals are making an assessment—at least implicitly—of the advantages and disadvantages to them of sharing information. They are determining that information sharing is, on balance, a net gain for them. But the aggregate effect of these decisions is to erode the expectation of privacy and also the role of privacy in fostering self-development, personhood, and other values that underlie the liberal way of life. In this way, individual choices are not sufficient to justify information practices that collectively undermine widely shared public values.”).

¹⁹⁷ Calo, *supra* note 195, at 1035.

that involve risk and the possibility of occasional mistakes and failures.”¹⁹⁸ As the old adage goes, “nothing ventured, nothing gained.”

[54] More concretely, the problem with “permissioning” innovation is that traditional regulatory policies and systems tend to be overly rigid, bureaucratic, costly, and slow to adapt to new realities.¹⁹⁹ Policies and regulatory systems based on precautionary thinking focus on preemptive remedies that aim to predict the future and its hypothetical problems, which may not ever come about. Worse yet, preemptive bans or regulatory prescriptions can limit innovations that yield new and better ways of doing things.²⁰⁰

[55] Regardless of whether the technical regulatory specifications for “permissioned” products and services are published in advance or whether firms must seek special permission before they offer a new product or service, both varieties of preemptive regulation have the same effect: they raise the cost of starting or running a business or nonbusiness venture and therefore discourage activities that benefit society. Such precautionary regulation can limit what Angela Benton, founder and CEO of NewME Accelerator, refers to as “democratized entrepreneurship,” or the sort of modern start-up culture that means “[j]ust about anyone can afford to launch a business.”²⁰¹ In turn, such limitation has implications for

¹⁹⁸ PERMISSIONLESS INNOVATION, *supra* note 7, at viii.

¹⁹⁹ See ABELSON ET AL., *supra* note 10, at 291 (“[B]ureaucracies change much more slowly than the technologies they govern.”).

²⁰⁰ See AARON WILDAVSKY, *SEARCHING FOR SAFETY* 183 (1988) (“Regulation, because it deals with the general rather than with the particular, necessarily results in forbidding some actions that might be beneficial. Regulators cannot devise specifications sufficiently broad to serve as guidelines for every contingency without also limiting some actions that might increase safety. Because regulation is anticipatory, regulators frequently guess wrong about which things are dangerous; therefore, they compensate by blanket prohibitions.”).

²⁰¹ Angela Benton, *Angela Benton on the Future of Entrepreneurship*, WALL ST. J. (July 7, 2014, 3:53 PM), <http://online.wsj.com/articles/angela-benton-on-the-future-of-entrepreneurship-1404762819>, archived at <http://perma.cc/5N38-WSEP>.

consumers and end users of technology. Overly prescriptive regulatory systems can raise the cost of goods and services, diminish the quality of those goods and services, or limit the range of choices that the public has at its disposal.²⁰² Thus, preemptive, precautionary constraints should generally be reserved for circumstances with immediate and extreme threat to safety, security, or privacy.

[56] Precautionary principle thinking is often discussed in the context of IoT. Recall, for example, Calo’s hypothetical rule that “limits the collection of information about consumers in order to reduce asymmetries of information.”²⁰³ Although Calo does not endorse the adoption of such a rule at this time, the cost of such a rule and comparable regulatory proposals should be taken into account and subjected to a strict benefit-cost analysis.²⁰⁴ Alleviating all “information asymmetries” would be impossible without sweeping and constant regulatory interventions. If such precautionary regulation were imposed on IoT technologies, it could stifle the provision of devices and services that could substantially improve consumer welfare.²⁰⁵

²⁰² PERMISSIONLESS INNOVATION, *supra* note 7, at viii.

²⁰³ Calo, *supra* note 195, at 1035.

²⁰⁴ See, e.g., Adam Thierer, *A Framework for Benefit-Cost Analysis in Digital Privacy Debates*, 20 GEO. MASON L. REV. 1055, 1066–69 (2013) [hereinafter *A Framework*], available at <http://mercatus.org/publication/framework-benefit-cost-analysis-digital-privacy-debates>, archived at <http://perma.cc/6UA4-7PUS>; FED. TRADE COMM’N, PROJECT NO. P135405, COMMENTS OF THE FUTURE OF PRIVACY FORUM 13 (2014), available at http://www.ftc.gov/sites/default/files/documents/public_comments/2014/01/00013-88250.pdf, archived at <http://perma.cc/FBX3-9H93> [hereinafter FUTURE OF PRIVACY FORUM] (“The value of the Internet of Things will largely come from rapidly evolving, beneficial uses of data. When considering whether the use of data is appropriate to the context, consideration should instead be given to the likely benefits and the risk, if any, of actual harm.”).

²⁰⁵ See, e.g., Adam D. Thierer, Testimony before the Senate Comm. on Commerce, Sci. & Transp.: A Status Update on the Development of Voluntary Do-Not-Track Standards 2–3 (Apr. 24, 2013) [hereinafter Testimony before the Senate],

[57] The same would likely be true if Chairwoman Ramirez’s approach to a preemptive data use “commandment” were enshrined into a law that said, “[t]hou shall not collect and hold onto personal information unnecessary to an identified purpose.”²⁰⁶ Such a precautionary limitation would certainly satisfy her desire to avoid hypothetical worst-case outcomes because, as she noted, “[i]nformation that is not collected in the first place can’t be misused,”²⁰⁷ but it is equally true that information that is never collected may never lead to serendipitous data discoveries or new products and services that could offer consumers concrete benefits. “The socially beneficial uses of data made possible by data analytics are often not immediately evident to data subjects at the time of data collection,” notes Ken Wasch, president of the Software & Information Industry Association.²⁰⁸ If academics and lawmakers succeed in imposing such precautionary rules on the development of IoT and wearable technologies, many important innovations may never see the light of day.

C. The Importance of Regulatory Patience and Humility

[58] An embrace of permissionless innovation over precautionary principle thinking requires that legislators and regulators understand that patience and humility are worth embracing as policy virtues.²⁰⁹ To the maximum extent possible, policymakers should exercise restraint and

²⁰⁹ *See, e.g.*, PERMISSIONLESS INNOVATION, *supra* note 7, at 34–35, 66.

resist the urge to try to plan the future and all the various scenarios—good or bad—that might come about. This policy can be labeled *forbearance*.

[59] FTC Commissioner Maureen K. Ohlhausen concisely elucidated the philosophy of forbearance in an October 2013 speech, “The Internet of Things and the FTC: Does Innovation Require Intervention?,” in which she noted that “[t]he success of the Internet has in large part been driven by the freedom to experiment with different business models, the best of which have survived and thrived, even in the face of initial unfamiliarity and unease about the impact on consumers and competitors.”²¹⁰

[60] Ohlhausen pointed out that the precautionary mindset is dangerous when enshrined into policy directives because regulators—in their zeal to correct for consumers’ supposed irrationality or ignorance—often ignore regulators’ irrationality or ignorance.²¹¹ In other words, regulators can spend so much time focused on the supposed irrationality of consumers and their openness to persuasion or manipulation that those regulators end up ignoring their own irrationality or ignorance. Regulators simply do not possess the requisite knowledge to perfectly plan for every conceivable outcome, and attempts to do so will likely have many unintended consequences.²¹²

[61] This is particularly true for information technology markets, which generally evolve much more rapidly than other sectors and especially more rapidly than the law itself.²¹³ Technology author Larry Downes

²¹⁰ Maureen K. Ohlhausen, Comm’r, Fed. Trade Comm’n, *The Internet of Things and the FTC: Does Innovation Require Intervention?*, Remarks Before the U.S. Chamber of Commerce 3 (Oct. 18, 2013), *available at* <http://www.ftc.gov/public-statements/2013/10/internet-things-ftc-does-innovation-require-intervention-0>, *archived at* <http://perma.cc/K3NW-N8S9>.

²¹¹ *See id.* at 3–4.

²¹² *See* ABELSON ET AL., *supra* note 10, at 159 (“Too often, well-intentioned efforts to regulate technology are far worse than the imagined evils they were intended to prevent.”).

notes that policymaking in the information age is inexorably governed by the “law of disruption” or the fact that “technology changes exponentially, but social, economic, and legal systems change incrementally.”²¹⁴ This law is “a simple but unavoidable principle of modern life,” he said, and it will have profound implications for the way businesses, government, and culture evolve.²¹⁵ “As the gap between the old world and the new gets wider,” he argues, “conflicts between social, economic, political, and legal systems” will intensify, and “[n]othing can stop the chaos that will follow.”²¹⁶

[62] That insight prompts Ohlhausen to caution her fellow regulators:

It is . . . vital that government officials, like myself, approach new technologies with a dose of regulatory humility, by working hard to educate ourselves and others about the innovation, understand its effects on consumers and the marketplace, identify benefits and likely harms, and, if harms do arise, consider whether existing laws and regulations are sufficient to address them, before assuming that new rules are required.²¹⁷

²¹³ See Collins et al., *supra* note 175, at 6 (“The key issue seems likely to be whether the regulators can work fast enough to keep up with what the technology is capable of doing. . . .”).

²¹⁴ LARRY DOWNES, *THE LAWS OF DISRUPTION: HARNESSING THE NEW FORCES THAT GOVERN LIFE AND BUSINESS IN THE DIGITAL AGE 2* (2009).

²¹⁵ *Id.*

²¹⁶ *Id.* at 2–3. In a similar sense, Andy Grove, former CEO of Intel, once reportedly said, “[h]igh tech runs three-times faster than normal businesses. And the government runs three-times slower than normal businesses. So we have a nine-times gap.” Lillian Cunningham, *Google’s Eric Schmidt Expounds on His Senate Testimony*, WASH. POST (Oct. 1, 2011), http://www.washingtonpost.com/national/on-leadership/googles-eric-schmidt-expounds-on-his-senate-testimony/2011/09/30/gIQAPyVgCL_story.html, archived at <http://perma.cc/UG4G-T5JQ>.

²¹⁷ Ohlhausen, *supra* note 210, at 3–4.

Compared to Chairwoman Ramirez’s policy approach, which is clearly based on precautionary principle thinking rooted in fears about hypothetical worst-case outcomes, Ohlhausen’s approach to technological innovation in this space is consistent with the permissionless innovation approach.

[63] If policymakers care about expanding innovation opportunities, boosting consumer choice, and enhancing human welfare, then the philosophy of humility and forbearance should guide public policy. “Policymakers should generally exercise restraint and resist the urge to try to plan the future and [anticipate] all the various scenarios—good or bad—that might come about.”²¹⁸ “Prospective regulation based on hypothesizing about future harms that may never materialize is likely to come at the expense of innovation and growth opportunities.”²¹⁹ “To the extent that any corrective action is needed to address harms, *ex post* measures, especially via the common law, are typically superior.”²²⁰

[64] Another lesson flows from this observation: not every wise ethical principle, social norm, or industry best practice automatically makes wise public policy prescriptions.²²¹ If policymakers hope to preserve a free and open society, they must not convert every ethical directive or societal norm—no matter how sensible—into a legal directive.

[65] For these reasons, more flexible, bottom-up approaches to solving complex problems are almost always superior to preemptive, precautionary, top-down controls. A variety of these less burdensome bottom-up solutions will be outlined in section VI.

²²¹ *See, e.g.*, PERMISSIONLESS INNOVATION, *supra* note 7, at viii.

[66] That being said, IoT and wearable technologies will raise many legitimate issues that deserve to be taken seriously and addressed in a constructive fashion. Some of these concerns, such as the safety of medical apps and wearable health devices, may raise some serious issues that deserve regulatory scrutiny. Such safety concerns will likely relate to only a subset of IoT devices, however. Privacy-related concerns will likely apply to a much wider class of IoT and wearable technologies, which is why those issues receive more attention in this paper. As will be noted next, traditional privacy regulatory paradigms and policies are likely to be unequipped to deal with some of these concerns.

IV. HOW THE INTERNET OF THINGS CHALLENGES TRADITIONAL PRIVACY NORMS AND LEGAL STANDARDS

[67] Because of the massive amount of information that IoT and wearable technologies can gather, privacy and security-related concerns will grow as these devices and services proliferate.²²² Users enjoy the personalization and customization that IoT and wearable technologies offer, yet those same capabilities that are so hotly demanded also exacerbate digital privacy and data security risks that already existed for traditional online services and technologies.²²³ These privacy- and

security-related concerns can arise with regard to access to the device itself (i.e., what happens if it is lost or stolen); access to the information the device shares with nearby devices or systems (i.e., information shared over Wi-Fi or other wireless systems); or access to information transmitted to the cloud or to any remote storage system.²²⁴

[68] This section will specifically explore how IoT technologies in general and wearables in particular challenge traditional privacy norms—both social and legal—and will explain why a more creative and flexible approach to dealing with these issues will be necessary. It is important that the privacy concerns regarding wearable technologies relate to both the users of those technologies and others in surrounding environments. For users, the privacy concern is that wearables allow a massive amount of data to be observed, gathered, and shared about them—potentially without their knowledge.²²⁵ Moreover, such data can be very sensitive—particularly the information related to their health or specific medical conditions.²²⁶ In turn, these new datasets might be used by third parties for marketing purposes, by employers for job-related purposes, or even by insurers to adjust user premiums. This possibility raises the specter of IoT

In these cases, the further transmission of his/her data is thus imposed on the user who cannot prevent it without disabling most of the functionalities of the device. As a result of this chain of actions, the IoT can put device manufacturers and their commercial partners in a position to build or have access to very detailed user profiles.”).

²²⁶ See Sacco, *supra* note 224 (“It’s the nature of the data that’s being collected This is really getting to the essence of our being. It’s hard to believe people are willing to share all this stuff, especially around health.”).

and wearable devices and the datasets they generate being used in a supposedly discriminatory fashion.

[69] There are also concerns for those in environments where others are using wearable technologies. Such individuals may not be able to control how the wearable technologies used by others might be capturing their actions or data, and it may prove difficult if not impossible for them to grant consent in such contexts.²²⁷

A. Growing Privacy-Related Regulatory Interest in IoT and Wearables

[70] Policymaker interest in IoT and wearable technology is growing, and getting the legislative and regulatory balance right will affect the potential for ongoing innovation in this arena. “Courts, regulators and lawmakers will be fighting over IoT privacy safeguards for years to come,” notes Patrick Thibodeau of *Computerworld*.²²⁸ In fact, that process has already begun.

[71] In April 2013, the FTC launched an inquiry into the “Privacy and Security Implications of the Internet of Things” and invited comments.²²⁹ That proceeding was followed by a daylong workshop on November 21, 2013, in Washington, DC.²³⁰ The agency released its final report, *The*

²²⁷ See ARTICLE 29 DATA PROTECTION WORKING PARTY, *supra* note 225, at 7 (“[C]lassical mechanisms used to obtain individuals’ consent may be difficult to apply in the IoT, resulting in a ‘low-quality’ consent based in a lack of information or in the factual impossibility to provide fine-tuned consent in line with the preferences expressed by individuals.”).

against the backdrop of broader privacy-related policy efforts. Federal and state lawmakers have introduced a variety of privacy-related measures in recent years,²³⁶ and regulatory interest in IoT and wearable technology is growing in Europe²³⁷ and Asia.²³⁸

B. IoT and the Fair Information Practice Principles

[73] What these efforts share is a desire to extend traditional privacy norms and protections to the world of “big data” and IoT. With more information being produced, collected, categorized, and repurposed than ever before, policymakers worry that new laws and preemptive regulations may be needed to head off potential worst-case scenarios.²³⁹

[74] Generally, these efforts have focused on translating traditional fair information practice principles (FIPPs) into a workable set of industry best practices. Modern privacy law and policy have been driven by a focus on these FIPPs and how they might guide data collection and use.²⁴⁰ Obama administration privacy reports have generally listed the following FIPPs: Individual Control (i.e., “notice and consent”), Transparency, Respect for Context, Security, Access, Accuracy, Focused Collection, and Accountability.²⁴¹ The administration has advocated that such principles govern private-sector data collection and use and that they be formally enshrined in a congressionally implemented Consumer Privacy Bill of Rights.²⁴² Congress has not yet acted on the administration’s request, however.

[75] That may be because lawmakers understand the challenge of applying FIPPs in a strict, legalistic fashion considering how rapidly technology, business practices, and consumer demands are evolving in the modern economy.²⁴³ The lack of policy action may also be due to a more fundamental problem that has long haunted privacy policy and

²⁴⁰ See Robert Gellman, Fair Information Practices: A Basic History 1, 12–14, 16–26 (Aug. 3, 2014) (unpublished manuscript), available at <http://bobgellman.com/rg-docs/rg-FIPShistory.pdf>, archived at <http://perma.cc/NL6V-5CEZ>.

enforcement: definitional confusion.²⁴⁴ Writing at the International Association of Privacy Professionals blog, Brooks Dobbs, chief privacy officer for KBM Group, notes that “the terms ‘personal data,’ ‘personal information,’ and ‘personally identifiable information’ are often used interchangeably, [but] it’s apparent they could easily be read to speak to fundamentally different things.”²⁴⁵ He notes:

[This is] an enormous problem at the heart of our profession. Simply stated, as privacy professionals, we generally believe our jobs revolve around maintaining controls for the appropriate use and disclosure of either PII or personal data, but we can’t agree on what those terms mean. This definitional problem is leading to monumental uncertainty at the core of our profession.²⁴⁶

Moreover, each of the core FIPPs is open to extensive interpretational disagreements among policymakers and privacy professionals alike. Brookings Institution scholars Benjamin Wittes and Wells C. Bennett conclude that privacy is “something of an intellectual rabbit hole, a notion so contested and ill-defined that it often offers little guidance to

²⁴⁴ See Adam Thierer, *Privacy, Security, and Human Dignity in the Digital Age: The Pursuit of Privacy in a World Where Information Control Is Failing*, 36 HARV. J.L. & PUB. POL’Y 409, 415, 424–35 (2013) [hereinafter *Privacy, Security, and Human Dignity*] (“[P]rivacy has always been a highly subjective philosophical concept. It is also a constantly morphing notion that evolves as societal attitudes adjust to new cultural and technological realities. For these reasons, America may never be able to achieve a coherent fixed definition of the term or determine when it constitutes a formal right outside of some narrow contexts.”).

²⁴⁵ Brooks Dobbs, *The Problem at the Heart of the Privacy Profession*, INT’L ASS’N PRIVACY PROFS. (May 19, 2014), <https://privacyassociation.org/news/a/the-problem-at-the-heart-of-the-privacy-profession-2/>, archived at <https://perma.cc/8R8S-82PX>.

²⁴⁶ *Id.*

policymakers concerning the uses of personal information they should encourage, discourage, or forbid.”²⁴⁷

[76] But these definitional dilemmas are only part of the problem. Even if “privacy” and the corresponding FIPPs could be defined with greater academic and legal rigor, an equally thorny problem arises when determining how to translate these principles into a workable enforcement regime for IoT and wearable technology. First Amendment–related hurdles to privacy enforcement may also exist. Those two issues will be discussed next.

C. Limitations of the Traditional “Notice and Consent” Model for IoT

[77] By their very nature, IoT and wearable technologies are always on, always sensing, always collecting, and always communicating. This condition will create major challenges for traditional FIPPs-based policymaking efforts. As FTC Chairwoman Ramirez notes, “the difficulties will be exponentially greater with the advent of the Internet of Things, as the boundaries between the virtual and physical worlds disappear.”²⁴⁸ She goes on to ask a series of questions about the rise of IoT and its implications for privacy best practices:

Will consumers understand that previously inert everyday objects are now collecting and sharing data about them? How can these objects provide just-in-time notice and choice if there is no user interface at all? And will we be

²⁴⁷ Benjamin Wittes & Wells C. Bennett, *Database and A Trusteeship Model of Consumer Protection in the Big Data Era*, GOVERNANCE STUDIES AT BROOKINGS 1, 1 (June 2014), available at <http://www.brookings.edu/research/papers/2014/06/04-database-trusteeship-consumer-protection-big-data-era-privacy>, archived at <http://perma.cc/8JN4-KEUX>.

²⁴⁸ Edith Ramirez, Chairwoman, U.S. Fed. Trade Comm’n, *The Internet of Things: Privacy and Security in a Connected World 4* (Nov. 19, 2013), available at <http://www.ftc.gov/public-statements/2013/11/opening-remarks-ftc-chairwoman-edith-ramirez-federal-trade-commission>, archived at <http://perma.cc/68H2-YW8H>.

asking consumers to make an unreasonable number of decisions about the collection and use of their data?²⁴⁹

“The answers to these and other questions may not be simple,” Ramirez says, “[b]ut in my mind the question is not *whether* the core principles of privacy by design, simplified choice, and transparency should apply to the Internet of Things. The question is *how* to adapt them to the Internet of Things.”²⁵⁰

[78] Alas, Ramirez does not offer a clear roadmap for how to do so. Nor has the FTC in its recent January 2015 staff report on Internet of Things issues. Although the agency “believes that providing notice and choice remains important,” it also noted that “offering notice and choice is challenging in the IoT because of the ubiquity of data collection and the practical obstacles to providing information without a user interface.”²⁵¹ That is hardly surprising, however, because it is almost impossible to envision how a rigid application of traditional notice and choice procedures to IoT would work in practice. The Future of Privacy Forum notes that while FIPPs “are a valuable set of high-level guidelines for promoting privacy, . . . given the nature of the technologies involved, *traditional* implementations of the FIPPs may not always be practical as the Internet of Things matures.”²⁵²

[79] For example, it is not even clear at the moment whether existing wearable technologies and mobile medical applications are in compliance with—or even need to be in compliance with—the Health Insurance Portability and Accountability Act (HIPAA),²⁵³ which governs the use of

²⁴⁹ *Id.*

²⁵⁰ *Id.*

²⁵² FUTURE OF PRIVACY FORUM, *supra* note 204, at 3.

“individually identifiable health information held by covered entities and their business associates and gives patients an array of rights with respect to that information.”²⁵⁴ As consumers use their smartphones and tablets as medical monitoring devices to compile data about their health and fitness and then share it with medical professionals or others, it will raise a variety of questions about HIPAA compliance as well as traditional FDA medical device regulatory compliance more generally.²⁵⁵

[80] Enforcing privacy best practices in an age of increasing device miniaturization means that, in many cases, it also will not be possible for consumers to read an organization’s privacy policy because many of these technologies will be too small to even have a display.²⁵⁶ Moreover, the sophistication of many of these devices and the sheer amount of data they collect make it difficult to devise a workable notice and choice regime that

²⁵³ See Anne Marie Helm & Daniel Georgatos, *Privacy and Mhealth: How Mobile Health “Apps” Fit into a Privacy Framework Not Limited to HIPAA*, 64 SYRACUSE L. REV. 131, 156 (2014).

²⁵⁵ See Mark Sullivan, *Health Apps Could Be Heading into a HIPAA Showdown*, VENTUREBEAT (June 13, 2014, 9:56 AM), <http://venturebeat.com/2014/06/13/health-apps-could-be-heading-into-a-hipaa-showdown>, archived at <http://perma.cc/Z7L7-485Q>.

²⁵⁶ The FDA has already struggled with this problem in the context of digital advertising for prescription drugs and medical devices. In doing so, the agency has actually discouraged the use of some social media sites, such as Twitter, if adequate disclosure is difficult. The draft guidance says, “If the firm concludes that adequate benefit and risk information, as well as other required information, cannot all be communicated within the same tweet, then the firm should reconsider using Twitter for the intended promotional message.” FOOD & DRUG ADMIN., U.S. DEP’T HEALTH & HUM. SERVS., GUIDANCE FOR INDUSTRY: INTERNET/SOCIAL MEDIA PLATFORMS WITH CHARACTER SPACE LIMITATIONS — PRESENTING RISK AND BENEFIT INFORMATION FOR PRESCRIPTION DRUGS AND MEDICAL DEVICES 7 (June 2014), available at <http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/UCM401087.pdf>, archived at <http://perma.cc/A69N-8Z6V>.

can foresee every possible misuse. As the recent White House *Big Data* report noted,

Big data technologies, together with the sensors that ride on the “Internet of Things,” pierce many spaces that were previously private. Always-on wearable technologies with voice and video interfaces and the arrival of whole classes of networked devices will only expand information collection still further. This sea of ubiquitous sensors, each of which has legitimate uses, make the notion of limiting information collection challenging, if not impossible.²⁵⁷

The White House concluded, “[t]ogether, these trends may require us to look closely at the notice and consent framework that has been a central pillar of how privacy practices have been organized for more than four decades.”²⁵⁸ In an accompanying report, the President’s Council of Advisors for Science and Technology concluded that, “[a]s a useful policy tool, notice and consent is defeated by exactly the positive benefits that big data enables: new, non-obvious, unexpectedly powerful uses of data.”²⁵⁹

[81] Many academics agree. Peppet says, “notice and choice is an ill fitting solution to these problems, both because Internet of Things devices may not provide consumers with inherent notice that data rights are implicated in their use and because sensor-device firms seem stuck in a notice paradigm designed for web sites rather than connected consumer goods.”²⁶⁰

D. The Possible Move Toward Use Restrictions for IoT

[82] In light of these problems, various academics, government officials, and even private companies have suggested that it may be necessary to move away from a policy approach rooted in notice and choice and toward a new regime based on use restrictions.²⁶¹

[83] Former FTC officials J. Howard Beales and Timothy J. Muris have argued that “government should base commercial privacy regulations and policies on the potential consequences for consumers of information use and misuse. This approach focuses attention on the relevant questions of benefits and costs, and offers a superior foundation for regulation,” they say.²⁶² Similarly, Craig Mundie, a senior advisor at Microsoft, says, “[t]he time has come for a new approach: shifting the focus from limiting the collection and retention of data to controlling data at the most important point—the moment when it is used.”²⁶³ Finally, in a recent report on revising data protection principles, Fred H. Cate of Indiana University, Peter Cullen of Microsoft, and Viktor Mayer-Schönberger of Oxford University argue that

As a practical matter, the evolution of data collection and data use necessitates an evolving system of information privacy protection. A revised approach should shift

²⁶⁰ Peppet, *supra* note 4, at 148.

²⁶¹ See Bambauer, *supra* note 243, at 270–71 (“Laws prohibiting specific uses of personal information can achieve the goals of privacy law without significantly curtailing the flow of truthful information. If we have reason to believe that a particular use diminishes social welfare, we can and should craft prohibitions on those specific uses.”).

²⁶² See, e.g., J. Howard Beales, III & Timothy J. Muris, *Choice or Consequences: Protecting Privacy in Commercial Information*, 75 U. CHI. L. REV. 109, 109 (2008).

²⁶³ Craig Mundie, *Privacy Pragmatism: Focus on Data Use, Not Data Collection*, 93 FOREIGN AFF., Mar./Apr. 2014, at 28, 29.

responsibility away from individuals and toward data collectors and data users, who should be held accountable for how they manage data rather than whether they obtain individual consent. In addition, a revised approach should focus more on data use than on data collection because the context in which personal information will be used and the value it will hold are often unclear at the time of collection.²⁶⁴

[84] Policymakers appear ready to move in this direction. The Obama administration's recent *Big Data* report suggested that "in instances where the notice and consent framework threatens to be overcome—such as the collection of ambient data by our household appliances—we may need to re-focus our attention on the context of data use, a policy shift presently being debated by privacy scholars and technologists."²⁶⁵ The White House argued that this sort of "responsible use framework" has many potential advantages:

It shifts the responsibility from the individual, who is not well equipped to understand or contest consent notices as they are currently structured in the marketplace, to the entities that collect, maintain, and use data. Focusing on responsible use also holds data collectors and users accountable for how they manage the data and any harms it causes, rather than narrowly defining their responsibility to whether they properly obtained consent at the time of collection.²⁶⁶

²⁶⁵ EXEC. OFFICE OF THE PRESIDENT, *supra* note 232, at 56.

²⁶⁶ *Id.*

The FTC’s January 2015 IoT staff report stopped short of endorsing a use-based approach, however. The agency said “staff has incorporated certain elements of the use-based model into its approach” but “has concerns . . . about adopting a pure use-based model for the Internet of Things.”²⁶⁷ The agency worried that “it is unclear who would decide which additional uses are beneficial or harmful” under a use-based approach and that it would “not address the privacy and security risks created by expansive data collection and retention” and “would not take into account consumer concerns about the collection of sensitive information.”²⁶⁸ The agency was, by contrast, much more focused on trying to make notice and choice work for the IoT, as well as pushing data minimization limitations on developers.²⁶⁹

[85] Nonetheless, many companies—including many large IoT players—have suggested they are open to a move toward use-based restrictions. The Transatlantic Computing Continuum Policy Alliance—which includes AT&T, General Electric, Intel Corporation, and Oracle Corporation—has filed comments with the FTC arguing as follows:

We need to move away from an approach centered on the collection of data to focus in practical terms on what happens to that data and how it’s used, bearing in mind the real world harms and consequences. That does not mean that there is no role for notice and choice, but rather that we must review the context of the implementation and potential societal benefits from how the information may be used to determine what controls are needed to protect privacy within the circumscribed use. We need to think through how we manage notice and choice—not to change

²⁶⁷ THE INTERNET OF THINGS: PRIVACY AND SECURITY IN A CONNECTED WORLD, *supra* note 231, at vi.

²⁶⁸ *Id.*, at vi–vii.

²⁶⁹ *See id.*, at 33.

existing privacy principles, but to provide more guidance about how to apply the existing principles in this new IoT environment.²⁷⁰

Such a move away from notice and consent and toward use-based limitations seems likely as IoT and wearable technologies evolve and make older enforcement methods less effective.²⁷¹ For technologies such as Google Glass and other wearables, it would be impossible for users to obtain notice and consent from every individual they randomly passed by on a sidewalk or at an event. By contrast, it might be possible to impose some limited use-based restrictions of wearables to achieve privacy or safety goals.

[86] For example, the use of wearables in certain sensitive environments (such as bathrooms or locker rooms) could be prohibited. Use-based restrictions might also be imposed for safety-related reasons as well. A state senator in Illinois recently introduced a bill that would prohibit drivers from wearing Google Glass while operating a vehicle.²⁷² Even if that measure does not pass, it is easy to imagine comparable

restrictions being imposed on the use of wearables while driving or operating heavy machinery.

E. The Problem of “Privacy Paternalism” and the Limits of Privacy “Harm”

[87] In crafting use-based restrictions, however, policymakers must exercise caution. Overly broad restraints could end up being tantamount to a de facto ban on *all* uses of certain IoT or wearable technologies. Moreover, policymakers must avoid converting their preferences—or the preferences of just a small but vocal group of regulation advocates—into paternalistic policies that limit individual autonomy.²⁷³ The goal of privacy policy should not be to prevent people from making choices that others feel are unwise.

[88] Privacy scholar Daniel J. Solove of the George Washington University School of Law has warned about privacy law’s “paternalism” problem.²⁷⁴ “Privacy regulation,” he notes, “risks becoming too paternalistic. Regulation that sidesteps consent denies people the freedom to make choices. The end result is that either people have choices that are not meaningful or people are denied choices altogether.”²⁷⁵

[89] Privacy is too subjective to have policymakers or academics dictating outcomes on the basis of their own preferences.²⁷⁶ As Solove

²⁷³ See Adam Thierer, *Is Privacy an Unalienable Right? The Problem with Privacy Paternalism*, TECH. LIBERATION FRONT (Jan. 27, 2014), <http://techliberation.com/2014/01/27/is-privacy-an-unalienable-right-the-problem-with-privacy-paternalism/>, archived at <http://perma.cc/3MUS-8GEH>.

²⁷⁶ See Thierer, *supra* note 244, at 414–21; Thomas M. Lenard & Paul H. Rubin, *The Big Data Revolution: Privacy Considerations* 24 (Dec. 2013) (unpublished manuscript), available at http://www.techpolicyinstitute.org/files/lenard_rubin_thebigdatarevolutionprivacyconside

notes, “the correct choices regarding privacy and data use are not always clear. For example, although extensive self-exposure can have disastrous consequences, many people use social media successfully and productively.”²⁷⁷ Generally speaking, barring a clear showing of actual—not prospective or hypothetical—harm,²⁷⁸ U.S. culture has rejected the paternalistic idea that law must “save us from ourselves” (i.e., from citizens’ own irrationality or mistakes).²⁷⁹ Importantly, the term *harm* in this context has usually been narrowly defined as action that poses a direct threat to human well-being, personal property, or the home.²⁸⁰ This is not to say emotional or psychic harm associated with privacy violations are ignored completely under U.S. law,²⁸¹ merely that a much higher bar

²⁷⁷ Solove, *supra* note 274, at 1895.

²⁷⁸ *See id.* at 1897 (“The law generally does not override consent, even with potentially dangerous activities As a general matter, the law refrains from restricting transactions that appear on the surface to be consensual, and the law will tolerate a substantial amount of manipulation and even coercion before it deems a transaction to be nonconsensual.”).

²⁷⁹ *See id.* (“People make decisions all the time that are not in their best interests. People relinquish rights and take bad risks, and the law often does not stop them.”).

²⁸⁰ *See* PRIVACILLA.ORG, THE PRIVACY TORTS: HOW U.S. STATE LAW QUIETLY LEADS THE WAY IN PRIVACY PROTECTION 15, (July 2002), http://www.privacilla.org/releases/Torts_Report.pdf, archived at <http://perma.cc/5YHW-Z6EB> (“Prescriptive regulation may be called for where there is significant risk to human life or health because the injuries people may suffer are irreversible or deadly. This makes compensation after the fact impossible or insufficient. Though suffering a privacy violation can be devastating, information policy can not be fairly characterized as an area of significant danger to human life or health.”).

²⁸¹ *See* Ryan Calo, *The Boundaries of Privacy Harm*, 86 IND. L.J. 1131, 1133 (2011); Daniel Solove, *Privacy and Data Security Violations: What’s the Harm?*, LINKEDIN (June 25, 2014), <https://www.linkedin.com/today/post/article/20140625045136-2259773-privacy-and-data-security-violations-what-s-the-harm>, archived at <https://perma.cc/5X89-RD6A>.

exists when attempting to make the case that those harms should be legally actionable.²⁸²

[90] That approach generally makes sense in light of both how subjective privacy can be and the high value Americans place on privacy in balancing it against other values, such as freedom of speech and journalistic freedoms (which will be discussed in the next section), as well as economic innovation and consumer choice. “We have fallen in love with this always-on world,” note Hal Abelson, Ken Ledeen, and Harry Lewis, authors of *Blown to Bits: Your Life, Liberty, and Happiness After the Digital Explosion*.²⁸³ “We accept our loss of privacy in exchange for efficiency, convenience, and small price discounts.”²⁸⁴ Although many privacy advocates are loath to hear it, the reality is that “[w]e give away information about ourselves—voluntarily leave visible footprints of our daily lives—because we judge, perhaps without thinking about it very much, that the benefits outweigh the costs. To be sure, the benefits are many,” argue Abelson, Ledeen, and Lewis.²⁸⁵

[91] This is why America’s privacy torts typically involve a careful weighing of competing values and why courts usually try to strike a balance among them. “Reasonable minds are bound to differ when deciding whether the likely psychic harms outweigh the social gains,” notes Jane Yakowitz Bambauer of the University of Arizona College of Law.²⁸⁶ “The values on both sides of the scale are inordinately difficult to measure.”²⁸⁷

²⁸² See Adam Thierer, *Privacy Law’s Precautionary Principle Problem*, 66 ME. L. REV. 467, 473–77 (2014) [hereinafter *Precautionary Principle*].

²⁸⁷ *Id.*

[92] For those reasons, use-based restrictions should not be converted into a regulatory straitjacket that uniformly mandates data collection and use practices according to a static, one-size-fits-all blueprint. The need for flexibility and adaptability will be paramount if innovation is to continue in this space.²⁸⁸

[93] For example, if policymakers attempt to craft a use-based restriction that prohibits the use of wearable data on grounds that it could be used to discriminate against users, lawmakers should narrowly tailor that rule to address truly invidious forms of racial, sexual, or religious discrimination.²⁸⁹ Of course, many antidiscrimination laws that might make such practices illegal anyway already exist.²⁹⁰ But the term *discrimination* should not be construed to include any form of service differentiation, such as tailored product offerings that help expand the range of consumer services.²⁹¹ In the future, some IoT developers might

²⁸⁸ See FUTURE OF PRIVACY FORUM, *supra* note 204, at 6 (“Even in circumstances where traditional [privacy policy] implementations may seem appropriate, however, flexibility is needed.”).

²⁸⁹ See Sam Pfeifle, *How Big Data Discriminates*, INT’L ASS’N PRIVACY PROFS. (June 24, 2014), https://www.privacyassociation.org/publications/how_big_data_discriminates, archived at <https://perma.cc/2UED-U2VK>.

²⁹⁰ See Bambauer, *supra* note 243, at 271 (“Antidiscrimination laws are prime examples of narrow use restrictions. Antidiscrimination laws restrict the use of race, age, sex, or medical information for hiring, housing, and lending decisions because the biases that result from use of this information, whether statistically rational or not, run against the public interest. These laws work well on the risk-utility calculator because they allow information to be exploited for all purposes except the ones that have been determined to be harmful or risky. The large, rich scholarship on discrimination law explores and debates the soundness of anti-discrimination measures. Curiously, the privacy and discrimination fields often work in isolation, without overt awareness that regulations called ‘privacy laws’ and those called ‘antidiscrimination laws’ often aim to prevent the same harms.” (internal citations omitted)).

²⁹¹ See Hal Varian, *Price Discrimination*, in 1 HANDBOOK OF INDUSTRIAL ORGANIZATION 597, 598 (Richard Schmalensee & Robert Willig eds., 1989), available at

craft creative data sharing policies that provide consumers with a wide variety of unanticipated benefits. Serendipitous discoveries and data-driven innovation can materialize only in a policy environment that embraces trial-and-error experimentation.²⁹² That is why flexible data collection and use proposals and evolving best practices will ultimately serve consumers better than one-size-fits all, top-down regulatory edicts.

[94] Even well-intentioned regulation can create complex and sometimes quite costly tradeoffs.²⁹³ Data collection has fueled a remarkable amount of the innovation in the modern economy.²⁹⁴ Privacy-

related mandates that propose curtailing the use of data could have several deleterious effects, including higher costs for consumers, a decrease in the content and services supported by that data collection and advertising, increased costs for smaller operators and new start-ups (meaning less competition overall), and perhaps even a decrease in America's global competitive advantage in the digital economy.²⁹⁵

[95] All these considerations and tradeoffs apply equally to IoT and wearable technologies. Health and fitness application providers already collect and sell a certain amount of user information to advertisers so they can create richer user profiles and deliver more relevant ads.²⁹⁶ Some users may find that creepy, but this process is what ensures the cost of such services remains low or even altogether free of charge. And users are always free to avoid such services completely if they fear such data collection practices.

[96] Instead of imposing these FIPPs in a rigid regulatory fashion, therefore, these privacy and security best practices will need to evolve gradually to new realities and be applied in a more organic and flexible fashion, often outside the realm of public policy. For example, providing consumers with adequate information about various data collection practices remains a sensible best practice for developers to follow, even if it proves difficult to enforce by law. Likewise, IoT developers would be wise to be highly transparent about their data use policies and also limit the amount of overall data collection to core functions as much as possible. Finally, they should limit retention of that data, limit sharing with too many third parties, and safeguard the data they collect against unauthorized interception or data breaches.

[97] The key takeaway from this discussion is that no silver-bullet solution to these complex privacy issues exists. As analysts with Morrison Foerster have argued, “threats to security and privacy vary considerably and the breadth of challenges presented means that a one-size-fits-all approach to policy and/or regulation is unlikely to work.”²⁹⁷ What is needed is a layered approach. Some potential responses will be outlined in section VI of this paper. But one additional complication needs to be discussed first: the First Amendment.

F. First Amendment–Related Hurdles to the Regulation of IoT and Wearable Technology

[98] To the extent that wearable technologies are used by individuals to record and gather video, audio, and other data, First Amendment rights may be implicated. There has long existed a tension between privacy and free speech rights, which will be greatly exacerbated by the rise of these IoT technologies.

[99] Legal scholar Rodney A. Smolla notes that “strong First Amendment doctrines stand in the way of many of the most meaningful privacy reforms.”²⁹⁸ In particular, legal scholars have long noted that press rights are also affected by stronger commercial privacy controls. Philosopher Judith Jarvis Thomson argues that “even if there is a right to not be caused distress by the publication of personal information, it is mostly, if not always, overridden by what seems to me a more stringent right, namely the public’s right to a press which prints any and all information, personal or impersonal, which it deems newsworthy. . . .”²⁹⁹

[100] But more than just journalistic freedoms are at stake here. The First Amendment protects the right of all citizens to observe and freely

²⁹⁷ Collins et al., *supra* note 175, at 2.

²⁹⁹ Judith Jarvis Thomson, *The Right to Privacy*, 4 PHIL. & PUB. AFF. 295, 310 (1975).

gather information about the world around them and to use various technologies to help them do so. As the Seventh Circuit explained in its 2012 decision in *ACLU v. Alvarez*,

The act of *making* an audio or audiovisual recording is necessarily included within the First Amendment's guarantee of speech and press rights as a corollary of the right to disseminate the resulting recording. The right to publish or broadcast an audio or audiovisual recording would be insecure, or largely ineffective, if the antecedent act of *making* the recording is wholly unprotected, as the State's Attorney insists. By way of a simple analogy, banning photography or note-taking at a public event would raise serious First Amendment concerns; a law of that sort would obviously affect the right to publish the resulting photograph or disseminate a report derived from the notes. The same is true of a ban on audio and audiovisual recording.³⁰⁰

Although some privacy theorists argue that data and data collection are not protected speech deserving First Amendment protection,³⁰¹ other scholars recognize that restrictions on data collection are restrictions on the free flow of information, which implicate the First Amendment.³⁰² This reasoning is supported by the Supreme Court's 2011 decision in *Sorrell v. IMS Health Inc.*, which struck down a state law prohibiting data aggregators from selling personal information to pharmaceutical

TIMES*, June 20, 2012, at A29, available at <http://www.nytimes.com/2012/06/20/opinion/free-speech-for-computers.html>, archived at <http://perma.cc/HK9M-KCKX>.

³⁰² See, e.g., Jane Yakowitz Bambauer, *Is Data Speech?*, 66 *STAN. L. REV.* 57, 57 (2014) (“Data privacy laws regulate minds, not technology. Thus, for all practical purposes, and in every context relevant to the privacy debates, data is speech.”).

companies, which in turn use the data to customize their marketing pitches to doctors.³⁰³ In line with a lower court ruling, the Supreme Court found that the regulation violated the First Amendment “because it restricts the speech rights of data miners without directly advancing legitimate state interests.”³⁰⁴ The Court’s ruling means that restrictions on the sale, disclosure, and use of personally identifying information will be subject to heightened judicial scrutiny in the future.

[101] This makes it clear how the First Amendment might pose a serious roadblock to more comprehensive regulation of IoT and wearable technologies—regardless of whether these devices and services are being used for commercial or noncommercial purposes. For example, consider technologies such as Google Glass and wearable clip-on cameras, which were discussed earlier. When individuals use these technologies in public spaces, it is likely that their First Amendment rights to record information and interactions would trump most privacy considerations.³⁰⁵ “Current U.S. privacy law recognizes only a very limited right of privacy in public, one that would likely not bar citizens from . . . gathering information through augmented-reality spectacles,” says Daxton “Chip” Stewart of Texas Christian University’s College of Communication.³⁰⁶ That will be equally true for many other IoT and wearable technologies.

³⁰³ See *Sorrell v. IMS Health Inc.*, 131 S. Ct. 2653, 2672 (2011).

³⁰⁴ Yara Tercero-Parker, *U.S. Supreme Court Questions State Drug Data Restrictions*, BIOETHICS INT’L (Apr. 27, 2011), <http://www.bioethicsinternational.org/blog/2011/04/27/us-supreme-court-questions-state-drug-data-restrictions>, archived at <http://perma.cc/3LKP-SCL7>; see also *Sorrell*, 131 S. Ct. at 2672.

³⁰⁵ See Seth F. Kreimer, *Pervasive Image Capture and the First Amendment: Memory, Discourse, and the Right to Record*, 159 U. PA. L. REV. 335, 398 (2011) (“Once we recognize that image capture is protected by principles of free expression, proposals to impose liability without observing the established limitations of privacy torts—either by common law innovation or by statute—raise serious constitutional questions. Such liability would facilitate interference with efforts by private individuals to preserve their observations for future review, reflection, and dissemination without any actual demonstration to a court of substantial countervailing privacy interests.”).

[102] Thus, when considering the application of traditional FIPPs in this context, policymakers would be wise to remember law professor Eugene Volokh's observation:

We already have a code of "fair information practices," and it is the First Amendment, which generally bars the government from controlling the communication of information (either by direct regulation or through the authorization of private lawsuits . . .), whether the communication is "fair" or not.³⁰⁷

This does not mean that government is completely powerless to impose privacy-related restrictions on some information-gathering efforts. As will be noted in section VI, some targeted statutes already exist that limit information gathering in highly sensitive contexts outside the scope of First Amendment protection.³⁰⁸ For example, though citizens have broad liberties to use cameras and recording devices in public, privacy torts and "peeping Tom" laws prohibit intrusive or surreptitious recording in private spaces or even in many public places. Also, the use of wearables in private spaces could be constrained by private contracts and property rights considerations, although enforcement challenges will be evident in this context, too. In other words, although limiting data collection proves challenging (either because of the practicality of doing so or because of First Amendment considerations), it might be possible to impose some limits or penalties on data dissemination after the fact.

[103] In sum, more expansive regulatory efforts aimed at clamping down on information collection efforts using IoT and wearable technologies are

³⁰⁶ Stewart, *supra* note 130, at 455–56.

³⁰⁸ See, e.g., Bambauer, *supra* note 243, at 267–68.

bound to face formidable First Amendment–related challenges.³⁰⁹ Policymakers will need to narrowly tailor privacy-related measures if they hope to avoid these complications.

V. THE ROLE OF RESILIENCY AND GRADUAL SOCIAL ADAPTATION

[104] Before discussing some of the ways that the public and policymakers might constructively address concerns about IoT and wearable technology, it is worth discussing the important—and quite often overlooked—role that social and individual adaptation plays with regard to new inventions.³¹⁰

A. From Resistance to Resiliency

[105] Citizen attitudes about these technologies will likely follow a cycle that has played out in countless other contexts; and “[t]hat cycle typically witnesses initial *resistance*, gradual *adaptation*, and then eventual *assimilation* of a new technology into society.”³¹¹ Some citizens will begin their relationship with these new technologies in a defensive crouch. In the extreme, if there is enough of a backlash, the initial resistance to these technologies might take the form of a full-blown “technopanic.”³¹²

³⁰⁹ See, e.g., Fred H. Cate & Robert Litan, *Constitutional Issues in Information Privacy*, 9 MICH. TELECOMM. & TECH. L. REV. 35, 51 (2002) (“[T]o the extent that privacy laws restrict expression, even if that expression is commercial, the First Amendment imposes a considerable burden on the government to demonstrate the need and effectiveness of those laws.”).

³¹⁰ See Adam Thierer, *Muddling Through: How We Learn to Cope with Technological Change*, TECH. LIBERATION FRONT (June 17, 2014), <http://techliberation.com/2014/06/17/muddling-through-how-we-learn-to-cope-with-technological-change>, archived at <http://perma.cc/WD4U-KZRN>.

³¹¹ See PERMISSIONLESS INNOVATION, *supra* note 7, at 53.

³¹² See Adam Thierer, *Technopanics, Threat Inflation, and the Danger of an Information Technology Precautionary Principle*, 14 MINN. J.L. SCI. & TECH. 309, 311 (2013).

[106] Over time, however, citizens tend to learn how to adapt to new technologies or at least become more resilient in the face of new challenges posed by modern technological advances. Andrew Zolli and Ann Marie Healy, authors of *Resilience: Why Things Bounce Back*, define *resilience* as “the capacity of a system, enterprise, or a person to maintain its core purpose and integrity in the face of dramatically changed circumstances.”³¹³ They continue,

To improve your resilience is to enhance your ability to resist being pushed from your preferred valley, while expanding the range of alternatives that you can embrace if you need to. This is what researchers call *preserving adaptive capacity*—the ability to adapt to changed circumstances while fulfilling one’s core purpose—and it’s an essential skill in an age of unforeseeable disruption and volatility.³¹⁴

Consequently, they note, “by encouraging adaptation, agility, cooperation, connectivity, and diversity, resilience-thinking can bring us to a different way of being in the world, and to a deeper engagement with it.”³¹⁵

[107] Those who propose more precautionary solutions to challenging social problems often ignore this uncanny ability of individuals and institutions to “bounce back” from technological disruptions and become more resilient in the process. Part of the reason precautionary thinking sometimes dominates discussions about emerging technologies is that many people hold a deep-seated pessimism about future developments and a belief that, with enough preemptive planning, they can anticipate and overcome any number of hypothetical worst-case scenarios.

³¹³ ANDREW ZOLLI & ANN MARIE HEALY, *RESILIENCE: WHY THINGS BOUNCE BACK* 7 (2012).

³¹⁴ *Id.* at 7–8.

³¹⁵ *Id.* at 16.

Consequently, their innate tendency not only to be pessimistic but also to want greater certainty about the future means that “the gloom-mongers have it easy,” notes author Dan Gardner.³¹⁶ “Their predictions are supported by our intuitive pessimism, so they *feel* right to us. And that conclusion is bolstered by our attraction to certainty.”³¹⁷ Clive Thompson, a contributor to *Wired* and the *New York Times Magazine*, also notes that

[D]ystopian predictions are easy to generate. . . . [and] doomsaying is emotionally self-protective: If you complain that today’s technology is wrecking the culture, you can tell yourself you’re a gimlet-eyed critic who isn’t hoodwinked by high-tech trends and silly, popular activities like social networking. You seem like someone who has a richer, deeper appreciation for the past and who stands above the triviality of today’s life.³¹⁸

[108] Luckily, as science reporter Joel Garreau reminds readers, “[t]he good news is that end-of-the-world predictions have been around for a very long time, and none of them has yet borne fruit.”³¹⁹ Doomsayers have a bad track record because they typically ignore how “humans shape and adapt [technology] in entirely new directions.”³²⁰ “Just because the problems are increasing doesn’t mean solutions might not also be increasing to match them,” Garreau correctly notes.³²¹

³¹⁶ DAN GARDNER, *FUTURE BABBLE: WHY EXPERT PREDICTIONS FAIL—AND WHY WE BELIEVE THEM ANYWAY* 141 (2010).

³¹⁷ *Id.*

³¹⁸ CLIVE THOMPSON, *SMARTER THAN YOU THINK: HOW TECHNOLOGY IS CHANGING OUR MINDS FOR THE BETTER* 283 (2013).

³¹⁹ GARREAU, *supra* note 150, at 148.

³²⁰ *Id.* at 95.

³²¹ *Id.* at 150–51.

[109] In their 2001 “Response to . . . Doom-and-Gloom Technofuturists,” John Seely Brown and Paul Duguid note that “technological and social systems shape each other. . . . [They] are constantly forming and reforming new dynamic equilibriums with far-reaching implications.”³²² “Social and technological systems do not develop independently,” rather, “the two evolve together in complex feedback loops, wherein each drives, restrains, and accelerates change in the other.”³²³

[110] This is how humans become more resilient and prosper, even in the face of sweeping technological change. Wisdom is born of experience, including experiences that involve risk and the possibility of occasional mistakes and failures while both developing new technologies and learning how to live with them.³²⁴ Citizens should remain open to new forms of technological change not only because doing so provides breathing space for future entrepreneurialism and invention, but also because it provides an opportunity to see how societal attitudes toward new technologies evolve—and to learn from that change. More often than not, citizens find creative ways to adapt to technological change by using a variety of coping mechanisms, new norms, or other creative fixes. Although some things are lost in the process, something more is typically gained, including lessons about how to deal with subsequent disruptions.

B. Case Study: The Rise of Public Photography

[111] Consider the jarring impact that the rise of the camera and public photography had on American society in the late 1800s.³²⁵ This case

³²² John Seely Brown & Paul Duguid, *A Response to Bill Joy and the Doom-and-Gloom Technofuturists*, in AAAS SCIENCE AND TECHNOLOGY POLICY YEARBOOK 2001 77, 79, 82 (Albert H. Teich, Stephen D. Nelson, Celia McEnaney & Stephen J. Lita eds., 2001).

³²³ *Id.* at 83.

³²⁴ See PERMISSIONLESS INNOVATION, *supra* note 7, at viii.

³²⁵ See Robert E. Mensel, *Kodakers Lying in Wait: Amateur Photography and the Right of Privacy in New York, 1885–1915*, 43 AMER. QUAR. 24, 25, 28 (1991).

study has implications for the debate over wearable technologies. Plenty of critics existed, and many average citizens were probably outraged by the spread of cameras³²⁶ because “[f]or the first time photographs of people could be taken without their permission—perhaps even without their knowledge,” notes Lawrence M. Friedman in his 2007 book, *Guarding Life’s Dark Secrets: Legal and Social Controls over Reputation, Propriety, and Privacy*.³²⁷

[112] In fact, the most important essay ever written on privacy law, Samuel D. Warren and Louis D. Brandeis’s famous 1890 *Harvard Law Review* essay “The Right to Privacy,” decries the spread of public photography. The authors lament that “[i]nstantaneous photographs and newspaper enterprise have invaded the sacred precincts of private and domestic life” and claim that “numerous mechanical devices threaten to make good the prediction that ‘what is whispered in the closet shall be proclaimed from the house-tops.’”³²⁸

[113] Despite the profound disruption caused by cameras and public photography, personal norms and cultural attitudes evolved quite rapidly as cameras became a central part of the human experience. In fact, instead of shunning cameras, most people quickly looked to buy one! At the same time, social norms and etiquette evolved to address those who would use cameras in inappropriate or privacy-invasive ways. In other words, citizens bounced back and became more resilient in the face of technological adversity.

[114] Although some limited legal responses were needed to address the most egregious misuses of cameras, for the most part the gradual evolution of social norms, public pressure, and other coping mechanisms combined

³²⁶ See *id.* at 29 (discussing of the anxieties caused by photography during this time).

³²⁷ LAWRENCE M. FRIEDMAN, *GUARDING LIFE’S DARK SECRETS: LEGAL AND SOCIAL CONTROLS OVER REPUTATION, PROPRIETY, AND PRIVACY* 214 (2007).

³²⁸ Samuel D. Warren & Louis D. Brandeis, *The Right to Privacy*, 4 HARV. L. REV. 193, 195 (1890).

to solve the “problem” of public photography. As will be noted in the next section, in much the same way IoT and wearable technology will likely see a similar combination of factors at work as individuals and society slowly adjust to the new technological realities of the time. The public will likely develop coping mechanisms to deal with the new realities of a world of wearable technologies and become more resilient in the process.

[115] That being said, resiliency should not be equated with complacency or a “just-get-over-it” attitude toward privacy and security issues. With time, it may very well be the case that people “get over” *some* of the anxieties they might hold today concerning these new technologies, but in the short run, IoT and wearable technologies will create serious social tensions that deserve serious responses.³²⁹ This paper will turn to some of those potential responses next.

VI. CONSTRUCTIVE SOLUTIONS TO COMPLEX PROBLEMS

[116] Even if it is true that precautionary regulation will be costly, counterproductive, or potentially ineffective—and should therefore be avoided if possible—this does not mean the various privacy and security challenges associated with IoT and wearable technologies can be ignored.

[117] As noted already, there are no silver-bullet solutions that can instantly or easily solve these complex problems. Instead, what is needed is a *layered* approach to addressing these concerns that incorporates many different solutions. This section outlines a variety of constructive approaches that can be tapped to address the various privacy and security concerns associated with these new innovations.

³²⁹ See Adam Thierer, *Can We Adapt to the Internet of Things?*, INT’L ASS’N PRIVACY PROFS. (June 19, 2013), https://www.privacyassociation.org/privacy_perspectives/post/can_we_adapt_to_the_internet_of_things, archived at <https://perma.cc/V3Q9-2QET>.

A. Digital Literacy: How Education and Etiquette Can Help

[118] One solution to the privacy, security, and safety concerns raised by IoT and wearable technologies is to better educate the public about the potential downsides associated with these technologies, as well as their proper and improper uses.³³⁰ This can be accomplished with a variety of education and awareness-building efforts.³³¹

[119] Such efforts are already the primary means of dealing with concerns about online child safety.³³² Much like today's policy debates over online privacy, early policy debates over online child safety focused on top-down regulatory solutions, including efforts to censor objectionable content.³³³ These efforts to devise legislative and regulatory responses to online safety concerns immediately faced both technical and legal challenges. Technically speaking, devising workable filtering mechanisms for a medium such as the Internet proved elusive. In terms of the law, at least in the United States, various First Amendment-based constraints made it impossible to devise constitutionally permissible restrictions.³³⁴

[120] After many years of trying and failing to impose such restrictions, policymakers and online safety experts instead turned their attention to educational and empowerment-based solutions.³³⁵ The educational

approaches that they tapped—which focused on media literacy strategies, critical thinking skills, and “digital citizenship”—are equally relevant in the context of online privacy.³³⁶ Digital citizenship efforts stress the importance of teaching both children and adults better online behavior, or “netiquette” (proper behavior toward others), which can promote both online safety and digital privacy goals.³³⁷ Digital literacy and digital citizenship efforts can help individuals understand the potential perils of oversharing information about themselves and others while simultaneously encouraging consumers to occasionally delete unnecessary

online information and cover their digital footprints in other ways.³³⁸ “We live in what one might call the Peeping Tom society,” argues Stanford law professor Lawrence M. Friedman, in that “[n]ew technology puts powerful tools for invading privacy into the hands of ordinary people.”³³⁹ Digital literacy and digital citizenship efforts can help address that problem.

[121] The Obama administration’s *Big Data* report included a short section on the need to “[r]ecognize digital literacy as an important 21st century skill,” noting,

In order to ensure students, citizens, and consumers of all ages have the ability to adequately protect themselves from data use and abuse, it is important that they develop fluency in understanding the ways in which data can be collected and shared, how algorithms are employed and for what purposes, and what tools and techniques they can use to protect themselves. Although such skills will never replace regulatory protections, increased digital literacy will better prepare individuals to live in a world saturated by data. Digital literacy—understanding how personal data is collected, shared, and used—should be recognized as an essential skill in K-12 education and be integrated into the standard curriculum.³⁴⁰

[122] In 2013, scholars affiliated with the Center on Law and Information Policy at the Fordham University School of Law released a good model for how to operationalize this vision. They launched a privacy education program “aimed at engaging middle school students in

discussions about privacy and its relevance in their lives.”³⁴¹ The resulting Volunteer Privacy Educators Program offered students some lessons about how to deal with social media and how to actively manage their digital reputation, as well as how to establish strong passwords and avoid behavioral advertising, if they were so inclined.³⁴²

[123] Governments can play an important role in facilitating education and awareness-building approaches. The FTC notes, “Consumer and business education serves as the first line of defense against fraud, deception, and unfair practices.”³⁴³ Toward that end, the FTC already partners with over a dozen other federal agencies to provide OnGuardOnline, a website that offers wide-ranging security, safety, and privacy tips for both consumers and businesses.³⁴⁴ Also, the FTC has created a YouTube page featuring informational videos on these issues.³⁴⁵

As part of its recent staff IoT report, the FTC said it “will develop new consumer and business education materials in this area” in coming months and years.³⁴⁶ The Federal Communications Commission also offers smartphone security advice on its website.³⁴⁷ Many privacy activists and privacy professionals already offer extensive educational programs and advice.³⁴⁸

B. Best Practices and Self-Regulation: Privacy and Security “By Design”

[124] Privacy and data security policies for IoT and wearable technology can also be governed by self-regulatory efforts.³⁴⁹ Developers have a vested interest in adopting best practices and codes of conduct because “only by developing solutions that are clearly respectful of people’s privacy, and devoting an adequate level of resources for disseminating and explaining the technology to the mass public” can companies expect to achieve widespread adoption of IoT technologies.³⁵⁰

³⁵⁰ INFSO D.4 NETWORKED ENTERPRISE & RFID INFSO G.2 MICRO & NANOSYSTEMS, *supra* note 52, at 21.

[125] “Compared to traditional government regulation,” notes FTC Commissioner Maureen Ohlhausen, “self-regulation has the potential to be more prompt, flexible, and responsive when business models or technologies change.”³⁵¹ Ohlhausen itemizes other advantages of self-regulation as follows:

- It is “easier to reconfigure than major regulatory systems that must be adjusted via legislation or agency rulemaking.”
- It “can also be well attuned to market realities where self-regulatory organizations have obtained the support of member firms. Their accumulated judgment and hands-on experience in their industries help create rules that are workable for companies.”
- It “also helps prompt compliance by allowing corporations to ‘buy-in’ to the process.”
- It “may also offer a less adversarial, more efficient dispute resolution mechanism than formal legal procedures.”
- It is “a useful option to resolve consumer concerns, so that government enforcement resources can be preserved for the most egregious cases of consumer harm.”
- “[T]he cost burden of a self-regulatory process falls on industry participants rather than American taxpayers.”³⁵²

[126] Importantly, Ohlhausen notes that “[s]elf-regulation may also be the only option for certain types of activity where government intervention is limited by the First Amendment.”³⁵³ For the reasons stated in section IV, this consideration is of obvious relevance to the use of wearable

³⁵³ *Id.*

technologies, which could be protected from regulation on free speech grounds.

[127] Industry self-regulation in this space can take the form of what is known as *privacy by design* and *security by design*.³⁵⁴ These terms generally refer to efforts by developers to “bake in” certain privacy and security practices and protections as they are designing and deploying new technologies.³⁵⁵ The Future of Privacy Forum has compiled a centralized resource of current standards and best practices to help firms address a wide variety of privacy concerns (e.g., app development, children’s privacy, locational privacy and mobile services, and online ads)³⁵⁶ and has also developed a blueprint to help organizations conduct privacy impact assessments for data-oriented innovations.³⁵⁷ The Council of Better Business Bureaus has also produced detailed best-practice guidelines for data security³⁵⁸ and data privacy for small businesses.³⁵⁹ Finally, privacy

expert Daniel Solove created TeachPrivacy, an educational resource to help train employees about privacy and data security matters.³⁶⁰

[128] What do privacy and security by design entail? There are several practical steps that developers of IoT and wearable technologies can take, including the following:

- **Proper use guidelines:** Developers should include clear warnings in their packaging materials that explain to new owners the dangers associated with inappropriate use of their technologies. Many of them already do so.
- **Transparency:** Giving consumers more and better information about their digital tools is one of the key objectives of best practice efforts.³⁶¹ “Transparency is crucial,” argues FTC Chairwoman Edith Ramirez, “As more and more of our devices become smarter and smarter, it is essential we know as much about them as they know about us—that we understand what information the devices are collecting and how it is being used or shared.”³⁶² Her colleague, FTC Commissioner Julie Brill, argues, “Manufacturers should deploy signals or consumer-friendly online dashboards that

Industry must ensure that consumers understand how they will benefit from the Internet of Things and see that measures are in place to promote consumer privacy and security.”).

³⁶² Ramirez, *supra* note 248, at 4.

explain—through sounds, pictures, or graphs—the data the device collects about consumers, the uses of the data, and who else might see it.”³⁶³ On their websites, developers should also clearly disclose how the data their devices collect are retained, if at all, by the company, or who else such data might be shared with, if anyone.

- **Data transfer or data minimization:** Developers should also make it easier to transfer or delete data when users so request. Developers should also look to minimize or delete unnecessary datasets that could open future privacy or security vulnerabilities.
- **Ongoing security notices and updates:** Ongoing software updates will be essential to ensure that vulnerabilities are patched as quickly as possible so that IoT does not become “the hacker’s new playground.”³⁶⁴
- **Better security through encryption:** Encryption, anonymization, and data *de-identification*—a term that refers to “storing and sharing the data without revealing the identity of the individuals involved”³⁶⁵—will also be important, even if imperfect.³⁶⁶

Felten, No Silver Bullet: De-identification Still Doesn’t Work 8 (July 9, 2014) (unpublished manuscript)

Why would developers adopt such best practices or codes of conduct voluntarily? Fear of legal liability and pressure from government officials are two possible explanations. But, in most cases, it comes down to good business. Many potential customers will care deeply about the privacy and security of their IoT and wearable devices and services.³⁶⁷ “The signs are already beginning to appear,” says Ann Cavoukian—who is widely credited with coining the term *privacy by design*—that “market leaders are embracing *Privacy by Design*, and are, in turn, reaping the benefits.”³⁶⁸

[129] The last thing that developers want on their hands is consumer backlash or unwanted press attention because of failures related to privacy or data security.³⁶⁹ Such failures could have profound consequences. “Not only should privacy protection be built in from the start, it also has to be communicated effectively to all stakeholders throughout the process,” says David Hoffman, director of Intel’s Security Policy and Global

Privacy Office.³⁷⁰ “Failure to do so may incur financial implications,” he believes.³⁷¹

[130] In essence, self-regulation comes down to organizations’ being good stewards of the information they gather and use.³⁷² Wittes and Bennett argue that this is “a relationship best seen as a form of trusteeship.”³⁷³

A user’s entrusting his or her personal data to a company in exchange for a service, we shall argue, conveys certain obligations to the corporate custodians of that person’s data: obligations to keep it secure, obligations to be candid and straightforward with users about how their data is being exploited, obligations not to materially misrepresent their uses of user data, and obligations not to use them in fashions injurious to or materially adverse to the users’ interests without their explicit consent. These obligations show up in nearly all privacy codes, in patterns of government enforcement, and in the privacy policies of the largest internet companies.³⁷⁴

³⁷⁰ Interview with David Hoffman, Dir., Intellectual Sec. Policy and Global and Privacy Office (May 23, 2014, 3:50 PM), *available at* <http://www.darkreading.com/why-is-privacy-important-to-security-practitioners-and-professionals/a/d-id/1269187?>, *archived at* <http://perma.cc/T5V8-D2TP>.

³⁷² *See, e.g.*, Letter from Ken Wasch, *supra* note 208, at 8 (“[T]o maximize the opportunities presented by the Internet of Things and data-driven innovation, policies should take a more practical approach, shifting responsibility away from data subjects toward data users, and increasing the emphasis on responsible data stewardship and accountability.”).

³⁷³ Wittes & Bennett, *supra* note 247, at 2.

³⁷⁴ *Id.*

The rise of privacy and security professionals is having an important influence on how privacy and security by design work in practice today. Privacy professionals come in many flavors, with titles such as chief privacy officer, chief information officer, chief data officer, data architect, and data ethicist.³⁷⁵ Daniel Solove notes that these privacy professionals “educate personnel to be mindful of privacy and influence software, product, and service design to be more privacy friendly. Privacy self-management thus has the salutary effect of creating beneficial structural privacy protections and accountability inside institutions.”³⁷⁶ Nothing better illustrates the growing role that these privacy professionals play today than the swelling membership ranks of the International Association of Privacy Professionals (IAPP), which trains and certifies privacy professionals. Membership in the IAPP, which was founded in 2000, grew to more than 15,000 by the end of 2013, up from 10,000 in March 2012 (see Figure 2).³⁷⁷

³⁷⁵ See Brad Peters, *Meet the CDO*, FORBES (Dec. 20, 2013, 2:00 PM), <http://www.forbes.com/sites/bradpeters/2013/12/20/meet-the-cdo>, archived at <http://perma.cc/KQ2E-FNVB>.

Figure 2. The Explosion of Privacy Professionals: International Association of Privacy Professionals Membership, 2000–2014

Source: International Association of Privacy Professionals.

Note: Data for 2004 and 2005 are unavailable.

[131] The reason all this activity by privacy professionals is so important is that, as Berkeley Law School professors Kenneth A. Bamberger and Deirdre K. Mulligan note, it is increasingly what happens “on the ground”—that is, the day-to-day management of privacy decisions through the interaction of privacy professionals, engineers, outside experts, and regular users—that is perhaps most important for protecting consumers’ privacy.³⁷⁸ They suggest that “governing privacy through flexible principles” may be optimal, or at least more feasible, when compared to other regulatory efforts.³⁷⁹ As more technology firms bring

³⁷⁸ Kenneth A. Bamberger & Deirdre K. Mulligan, *Privacy on the Books and on the Ground*, 63 STAN. L. REV. 247, 249–50 (2011).

³⁷⁹ *Id.* at 253.

on privacy and security professionals, this process of “baking in” best practices becomes more routine, and compliance becomes easier over time.

[132] Of course, as the FTC’s Ohlhausen also observes, “self-regulation is not a perfect solution, nor can it be a complete substitute for traditional regulation.”³⁸⁰ She argues that “it’s important that self-regulation is backed up by enforcement. . . . If a company makes a promise publicly and it doesn’t adhere to that, we can bring an enforcement action.”³⁸¹ In this regard, the FTC’s important regulatory backstop role will be discussed later in this paper.

[133] Regardless of whether they will be enforced internally by firms or by ex post FTC enforcement actions, best practices must not become a heavy-handed, quasi-regulatory straitjacket. A focus on security and privacy by design does not mean those are the only values and design principles that developers should focus on when innovating. Cost, convenience, choice, and usability are all important values too. In fact, many consumers will prioritize those values over privacy and security—even as activists, academics, and policymakers simultaneously suggest that more should be done to address privacy and security concerns.

[134] Finally, best practices for privacy and security issues will need to evolve as social acceptance of various technologies and business practices evolve. For example, had “privacy by design” been interpreted strictly when wireless geolocation capabilities were first being developed, these technologies might have been shunned because of the privacy concerns they raised. With time, however, geolocation technologies have become a better understood and more widely accepted capability that consumers

³⁸⁰ Maureen K. Ohlhausen, Comm’r, Fed. Trade Comm’n, *Success in Self-Regulation: Strategies to Bring to the Mobile and Global Era*, Speech at the BBB Self-Regulation Conference 4 (June 24, 2014), available at http://www.ftc.gov/system/files/documents/public_statements/410391/140624bbbself-regulation.pdf, archived at <http://perma.cc/JU7Y-TLAB>.

³⁸¹ Bracy, *supra* note 349.

have come to expect will be embedded in many of their digital devices.³⁸² Those geolocation capabilities enable services that consumers now take for granted, such as instantaneous mapping services and real-time traffic updates.

[135] This is why flexibility is crucial when interpreting the privacy and security best practices.

C. Empowerment Solutions

[136] Although IoT innovation is occurring at a breakneck pace, it may nonetheless be possible that technological self-help solutions will emerge to help individuals and organizations better protect their privacy and security.³⁸³ More robust, end-to-end encryption will certainly be a major part of the solution. As Gershenfeld and Vasseur conclude,

[P]rivacy can be protected on the Internet of Things. Today, privacy on the rest of the Internet is safeguarded through cryptography, and it works: recent mass thefts of personal information have happened because firms failed to encrypt their customers' data, not because the hackers broke through strong protections. By extending cryptography down to the level of individual devices, the owners of those devices would gain a new kind of control over their personal information. Rather than maintaining secrecy as an absolute good, it could be priced based on the value of sharing. Users could set up a firewall to keep private the Internet traffic coming from the things in their homes—or they could share that data with, for example, a

³⁸² See Bambauer, *supra* note 243, at 238.

³⁸³ See generally Kashmir Hill, *Forget Glass: Here Are Wearables That Protect Your Privacy*, FORBES (July 29, 2014, 11:20 AM), <http://www.forbes.com/sites/kashmirhill/2014/07/29/forget-glass-here-are-wearables-that-protect-your-privacy>, archived at <http://perma.cc/EB62-6XQJ> (describing different wearables that protect privacy).

utility that gave a discount for their operating their dishwasher only during off-peak hours or a health insurance provider that offered lower rates in return for their making healthier lifestyle choices.³⁸⁴

Other creative solutions will likely emerge as problems develop. Roger A. Grimes, a security expert with Microsoft, argues that “what we need is device identity. In order for us to begin securing IoT, we have to be able to reliably authenticate devices and apply the appropriate security controls to those devices—and be able to identify misbehaving devices and remediate them.”³⁸⁵ “The real way to decrease Internet crime is to make it harder for the bad guys to get away with malicious hacking. Once the bad guys realize that they’re likely to get caught—and those who get away with it don’t make much money—Internet crime will decrease,” he argues.³⁸⁶

[137] Better device authentication mechanisms could help address this. Computer scientists at the University of California, San Diego, recently announced the development of a tool that “tags critical pieces in a hardware’s security system and tracks them.”³⁸⁷ This tool will help IoT developers and users detect security vulnerabilities that can compromise a device’s security and address them before problems develop. “IoT isn’t a frightening giant ogre,” argues security consultant Jim O’Reilly, “[i]f we stop admiring how big it is and realize the devil is in the details, we should be able to handle IoT just fine.”³⁸⁸

³⁸⁴ Gershenfeld & Vasseur, *supra* note 18.

[138] An extensive array of privacy-enhancing technologies and consumer information is already available on the market today to help users block or limit data collection or help them achieve a more anonymous browsing experience.³⁸⁹ Some of those tools can help users protect their privacy as they start using more IoT and wearable technologies.

[139] Other technological empowerment fixes will emerge spontaneously to address new IoT-related challenges as they develop. For example, *Wired* recently profiled a Berlin artist who wrote a simple program to detect any Google Glass device attempting to connect to a Wi-Fi network and alert those in the area that someone is using Glass nearby.³⁹⁰ The program could even send a “deauthorization” command, cutting the Wi-Fi connection for the headset.³⁹¹

[140] As noted next, firms have a powerful incentive to handle security concerns preemptively to avoid liability and negative press attention down the road. Industry consortia can help achieve security in a more collective fashion through best practices. For example, in early 2014, the Industrial Internet Consortium was established to “further the development, adoption, and wide-spread use of interconnected machines, intelligent

analytics, and people at work,”³⁹² and “[b]uild confidence around new and innovative approaches to security.”³⁹³ Founding members include AT&T, Cisco, IBM, Intel, and General Electric.³⁹⁴ As firms investigate and establish innovative approaches to security in web-connected industrial gear, eventually those best practices will be applied to consumer devices and systems as well.³⁹⁵

D. Common-Law Solutions, Evolving Liability Standards, and Other Legal Recourses

[141] Torts and other legal mechanisms will also continue to play a role in protecting privacy and data security.³⁹⁶ Privacy torts evolved fairly recently compared to other common-law torts, but it is probable that—like other torts—they will continue to evolve in response to technological change and provide more avenues of recourse to plaintiffs seeking to protect their privacy rights.³⁹⁷ The four privacy torts are public disclosure

of private facts, intrusion upon seclusion, false light, and appropriation of name or likeness.³⁹⁸

[142] The tort of intrusion upon seclusion may evolve in response to some of the specific technological changes outlined in this paper and in the process provide additional remedies to perceived privacy harms.³⁹⁹ This tort states, “One who intentionally intrudes, physically or otherwise, upon the solitude or seclusion of another or his private affairs or concerns, is subject to liability to the other for invasion of his privacy, if the intrusion would be highly offensive to a reasonable person.”⁴⁰⁰ Cases flowing from this tort have dealt with involuntary exposure in public⁴⁰¹ and “overzealous” surveillance⁴⁰² activities, as well as entering a person’s home under false pretenses and recording their activities.⁴⁰³ It would not be surprising to see future privacy-related controversies give rise to more legal actions involving the tort of intrusion upon seclusion because, as Bambauer notes, it “offers the best theory to target legitimate privacy harms in the information age.”⁴⁰⁴

extensive regulations they propose come into direct conflict with traditional American normative commitments to the free flow of information.”).

⁴⁰⁴ Bambauer, *supra* note 243, at 205 (“The tort of intrusion upon seclusion offers the best theory to target legitimate privacy harms in the information age.”).

[143] Other federal and state laws already exist that could address privacy concerns.⁴⁰⁵ Property law already addresses trespass, and future court rulings could see property norms extended to cover new types of harms involving wearable technologies.⁴⁰⁶ State Peeping Tom laws that prohibit peering into individual homes or even surreptitious spying in public also exist.⁴⁰⁷ The Video Voyeurism Prevention Act imposes fines and even jail time on those who have an “intent to capture an image of a private area of an individual without their consent, and knowingly does so under circumstances in which the individual has a reasonable expectation of privacy.”⁴⁰⁸ The Fair Credit Reporting Act also already offers consumers access and correction remedies for their credit records, and its provisions may apply to some of the records created through new IoT technologies.⁴⁰⁹

[144] Contract law can also act as a powerful deterrent to the misuse of IoT and wearable technologies, not only in the workplace, but in many other formal relationships. State officials—state attorneys general in

⁴⁰⁵ See, e.g., Micah Singleton, *Defining Privacy in the Age of Wearable Cameras*, KERNEL (Sept. 14, 2014), <http://kernelmag.dailydot.com/issue-sections/features-issue-sections/10248/glass-wearable-cameras-legal-privacy>, archived at <http://perma.cc/2UD7-WJ2S> (“Perhaps, though, instead of a surge of new laws, we may witness current laws against recording people without consent enforced more actively, as wearables continue to get smaller and more advanced.”).

⁴⁰⁶ See, e.g., Jim Harper, CATO Institute, *Consumer Online Privacy*, Remarks at the Committee on Commerce, Science, and Transportation (July 27, 2010), available at <http://www.cato.org/publications/congressional-testimony/consumer-online-privacy>, archived at <http://perma.cc/7GVT-ZR4D> (“Real property law and the law of trespass mean that people have legal backing when they retreat into their homes, close their doors, and pull their curtains to prevent others from seeing what goes on within.”).

particular—also continue to push for new policies addressing privacy and data security, many of which are often more stringent than federal law.⁴¹⁰

[145] Ironically, the fact that IoT and wearable technology developers may be collecting massive volumes of new data could open those developers up to new forms of liability. In the context of intelligent vehicle technology, for example, Bryant Walker Smith of Stanford Law School notes that liability norms will likely be affected by the level of knowledge and control that manufacturers have over those systems.⁴¹¹ “A seller who can, does, or should know more about the products it sells may be expected to foresee a wider range of product-related uses, misuses, and harms,” he argues.⁴¹² In other words, as IoT and wearable technology application developers come to possess a greater volume of data about what users are doing with their devices and services, liability could expand over time for those developers.⁴¹³ These developers could become what economists refer to as the “least cost avoider” or the party who is in the

⁴¹⁰ See, e.g., CHRISTOPHER WOLF, BUREAU OF NAT’L AFFAIRS, INC., TARGETED ENFORCEMENT AND SHARED LAWMAKING AUTHORITY AS CATALYSTS FOR DATA PROTECTION IN THE U.S., PRIVACY & SECURITY LAW REPORT 2 (2010), available at <http://www.hldataprotection.com/uploads/file/PDFArtic.pdf>, archived at <http://perma.cc/V6SV-89W5> (“At the state level, legislatures have become the proving grounds for new statutory approaches to privacy regulation. Some of these developments include the enactment of data security breach notification laws . . . as well as highly detailed data security laws, enacted largely in response to data breaches. This partnership has resulted in a set of robust standards for the protection of personal data.”).

⁴¹¹ See Bryant Walker Smith, *Proximity-Driven Liability*, 102 GEO. L.J. 1777, 1779 (2014).

⁴¹² *Id.* at 1799.

⁴¹³ See *id.* (“Since a product use or misuse that should be known to the seller is likely to be foreseeable, this information can also expand the content of other duties.”).

best position to minimize risk at the lowest cost.⁴¹⁴ Smith refers to this as “proximity-driven liability.”⁴¹⁵

[146] This observation will likely also be true for other smart systems as new legal standards and responsibilities evolve gradually through a body of common-law cases, as they have for many other technologies. Brookings Institution scholar John Villasenor notes that

[W]hen confronted with new, often complex, questions involving products liability, courts have generally gotten things right. . . . Products liability law has been highly adaptive to the many new technologies that have emerged in recent decades, and it will be quite capable of adapting to emerging autonomous vehicle technologies as the need arises.⁴¹⁶

Thus, instead of trying to micromanage the development of IoT technologies in an attempt to plan for every hypothetical risk scenario, policymakers should be patient while the common law evolves and liability norms adjust.⁴¹⁷ Traditionally, the common law has dealt with products liability and accident compensation in an evolutionary way through a variety of mechanisms, including strict liability, negligence, design defects law, failure to warn, and breach of warranty.⁴¹⁸ There is no

⁴¹⁷ See, e.g., *The Internet of Things (To Be Hacked)*, *supra* note 367 (“[Governments] should make clear that web-connected gadgets are covered by existing safety laws and existing product-liability regimes.”).

reason to think that the common law will not adapt to new technological realities, including IoT and wearable technologies, especially since firms have powerful incentives to improve the security of their systems and avoid punishing liability, unwanted press attention, and lost customers.⁴¹⁹

E. Federal Trade Commission Oversight and Enforcement

[147] The FTC has already played a major role in addressing concerns about privacy and security for today's leading online technologies. The agency has used its broad authority under section 5 of the Federal Trade Commission Act, which prohibits "unfair or deceptive acts or practices in or affecting commerce."⁴²⁰ Section 5 gives the FTC remarkably broad authority to address alleged violations of data privacy and security standards. Bamberger and Mulligan note that "since 1996 the FTC has actively used its broad authority under section 5 . . . to take an active role in the governance of privacy protection, ranging from issuing guidance regarding appropriate practices for protecting personal consumer

⁴³³ See Daniel J. Solove & Woodrow Hartzog, *The FTC and The New Common Law of Privacy*, 114 COLUM. L. REV. 583, 610 (2014) (stating that the FTC has issued over 170 privacy-related complaints).

⁴³⁴ Maneesha Mithal, Assoc. Dir. of the Div. of Privacy and Identity Prot., Fed. Trade Comm’n, Statement of the Federal Trade Commission on Emerging Threats in the Online Advertising Industry Before the S. Comm. on Homeland Sec. and Governmental Affairs Permanent Subcomm. on Investigations (May 15, 2014), available at

[149] Companies fear such FTC enforcement actions because they can bind a company to lengthy, twenty-year privacy audits⁴³⁵ and open it up to potential liability of up to \$16,000 per customer harmed per violation.⁴³⁶ Moreover, firms take a reputation hit with the press and the general public when such enforcement actions are handed down.

[150] Leading privacy scholars have argued that “the principles that emerge from FTC privacy ‘common law’ [demonstrate] that the FTC’s privacy jurisprudence is quite thick.”⁴³⁷ At a minimum, these enforcement actions make it clear that the agency already possesses plenary authority under section 5 to “make sure companies live up to the privacy promises they make to consumers.”⁴³⁸

[151] The agency has also released industry best-practice guidance for mobile app data collection and privacy practices,⁴³⁹ digital advertising

security; and that the mere fact that a breach occurred does not mean that a company has violated the law.”⁴⁴⁴ Such enforcement constraint and flexibility will be essential if IoT and wearable technologies are to realize their full potential.

F. Social Norms, Pressure, and Sanctions

[153] Norms—“social attitudes of approval and disapproval, specifying what ought to be done and what ought not to be done”⁴⁴⁵—can play a powerful role in curbing potentially problematic behavior by both the developers of IoT and its users. Indeed, the power of social norms in this context could become a crucial determinant of the popularity of many wearable technologies.

[154] Sometimes cultural norms, public pressure, and spontaneous social sanctions form a far more powerful “regulator” of innovations and how people use new tools than do laws and regulations.⁴⁴⁶ Cristina Bicchieri, a leading behavioral ethicist, calls social norms “the grammar of society” because,

[L]ike a collection of linguistic rules that are implicit in a language and define it, social norms are implicit in the operations of a society and make it what it is. Like a grammar, a system of norms specifies what is acceptable and what is not in a social group. And analogously to a grammar, a system of norms is not the product of human design and planning.⁴⁴⁷

⁴⁴⁴ Mithal, *supra* note 434, at 12.

⁴⁴⁶ PERMISSIONLESS INNOVATION, *supra* note 7, at 57–58.

⁴⁴⁷ CRISTINA BICCHIERI, *Preface to The GRAMMAR OF SOCIETY: THE NATURE AND DYNAMICS OF SOCIAL NORMS* ix (Cambridge Univ. Press 2006).

Indeed, social pressure and constraints on the use and misuse of technology often develop in an organic, bottom-up fashion. For example, social norms continue to evolve to deal with smartphone usage in various environments, such as in some restaurants, most movie theaters, and gym locker rooms, where their use is frowned upon or actively discouraged. In some cases, social norms and constraints take the form of formal restrictions imposed by establishments themselves. Other times, however, social pressure develops more spontaneously from other people in the vicinity. For example, theaters use preshow messaging to pressure patrons to mute or turn off electronic devices, but other moviegoers are equally likely to make their displeasure with interruptions known to offending parties. Likewise, some passenger trains include “quiet cars,” where phone conversations are prohibited, and other riders often scold passengers who ignore those rules.⁴⁴⁸ Finally, while fitness centers often post signs disallowing the use of smartphones in locker rooms, anyone attempting to use them to take pictures would likely quickly meet the wrath of offended patrons.

[155] In a similar way, it is likely that social norms and pressures will influence the development and use of wearable computing technologies, such as Google Glass and other wearable devices.⁴⁴⁹ “I can imagine social norms emerging on when it’s appropriate to wear a camera, and when it isn’t appropriate,” says privacy lawyer Kurt Wimmer.⁴⁵⁰ Advice columns are already being written about “Google Glass etiquette.” Their recommendations include taking Google Glass off when first meeting

⁴⁴⁸ See, e.g., Vincent M. Mallozzi, *On Train, a Fight Between Silent and Merely Quiet*, N.Y. TIMES, Jan. 10, 2011, at A17, available at <http://www.nytimes.com/2011/01/10/nyregion/10quiet.html>, archived at <http://perma.cc/3G59-3RQW>.

⁴⁴⁹ See, e.g., Jared Newman, *The Real Privacy Implications of Google Glass*, TIME, (May 2, 2013), <http://techland.time.com/2013/05/02/the-real-privacy-implications-of-google-glass>, archived at <http://perma.cc/RR93-TWWA>.

⁴⁵⁰ See, e.g., Singleton, *supra* note 405.

someone; removing it immediately when others seem uncomfortable; and never wearing it in bathrooms or other highly private settings.⁴⁵¹

[156] More forceful opposition to Google Glass and other wearable computing or recording devices may develop in the future. Stop the Cyborgs is an advocacy group that offers various resources to push back against these technologies, including free downloadable “Google Glass ban signs” that can be displayed in places where such technologies may not be welcome.⁴⁵² The group also offers stickers and shirts that convey the same message.

[157] In the extreme, social sanction can sometimes even involve violence or the threat thereof. For example, in February 2014, a woman who wore Google Glass into a San Francisco bar was verbally and physically assaulted by a man who was upset about potentially having his privacy invaded.⁴⁵³ It would be extremely unfortunate if tensions over wearable technologies resulted in violent altercations, but these early incidents may have the salubrious side effect of reminding users that not

everyone shares their privacy values and that public uses of wearable technologies should be moderated accordingly.⁴⁵⁴

[158] Social norms and pressure can also be applied at the developer level to influence design choices. The behavior of developers of IoT and wearable technology will likely be influenced by the pressure applied by the broad and growing collection of privacy watchdog groups that exist, including the American Civil Liberties Union (ACLU), the Center for Democracy and Technology, the Electronic Frontier Foundation, the Electronic Privacy Information Center, the Future of Privacy Forum, Privacy Rights Clearinghouse, and many others.⁴⁵⁵ These advocacy groups have developed websites and materials to better inform consumers about how they can protect their privacy.⁴⁵⁶ Such organizations agitate for more rigorous privacy protections incessantly, and privacy policies—both legal enactments and informal corporate standards—will continue to be significantly influenced by the pressure that these advocates exert on the process. Furthermore, there has been an explosion of academic interest in privacy-related matters in recent years, and this too influences developer behavior.

[159] Finally, media attention also plays an important role in curbing potentially problematic behavior—by individuals and developers alike. FTC Chairwoman Ramirez notes that

[M]edia organizations . . . have a vital role to play as well. In recent years, premier news organizations have paid increasing attention to consumer privacy issues, publicizing excesses in some data gathering methods. Such public

scrutiny gives firms a powerful incentive to act as responsible stewards of consumer information.⁴⁵⁷

There already exists intense media and blogger interest in the privacy and security-related implications of IoT and wearable technologies, and that coverage will likely grow as these devices and services multiply.

G. Law Enforcement Guidelines and Restrictions

[160] The use of wearable technologies by law enforcement officials—or law enforcement’s ability to tap into private data flow from wearable devices—deserves special scrutiny and additional legal protections for the public. There are significant differences between public and private entities, and policymakers should continue to distinguish between them when considering data collection policies.⁴⁵⁸ Private entities cannot fine, tax, or imprison people because they lack the coercive powers that governments possess. Moreover, although it is possible to ignore or refuse to be a part of various private services, the same is not true for governments, whose grasp cannot be evaded. Thus, special protections regarding wearables, IoT devices, and data flows are needed for law enforcement agencies and officials.

[161] The ACLU has developed a set of best practices for law enforcement use of “body cams” or “cop cams,” which can be used to record an officer’s interactions with the public.⁴⁵⁹ The ACLU suggests,

⁴⁵⁷ Edith Ramirez, Chairwoman, Fed. Trade Comm’n, Protecting Consumer Privacy in a Big Data Age, Speech at the Media Institute, Washington, D.C. 12 (May 8, 2014), available at http://www.ftc.gov/system/files/documents/public_statements/308421/140508mediainstitute.pdf, archived at <http://perma.cc/L282-DQPA>.

⁴⁵⁸ See Adam Thierer, *Do We Need a Constitutional Amendment Restricting Private-Sector Data Collection?*, INT’L ASS’N OF PRIVACY PROF’L (Jan. 23, 2014), <https://privacyassociation.org/news/a/do-we-need-a-constitutional-amendment-restricting-private-sector-data-colle/>, archived at <https://perma.cc/8H66-6Z5S>.

among other things, that citizens be notified that they are being recorded, that data “be retained no longer than necessary for the purpose for which it was collected,” and “that this technology not become a backdoor for any kind of systematic surveillance or tracking of the public.”⁴⁶⁰

[162] When government seeks access to privately held data collected from wearables or other IoT technologies, strong constitutional and statutory protections should apply. Privacy advocates fear that “the government will inevitably demand access” to any private data that is collected for commercial purposes,⁴⁶¹ but to the extent that this is a growing problem, those advocates should redouble their efforts to constrain government surveillance powers and the ability to indiscriminately suck up privately held data. Congress should reform the Electronic Communications Privacy Act of 1986 (the primary federal statute that governs when law enforcement agencies may compel private entities to divulge information held on behalf of third-party subscribers) to require the government to obtain a warrant issued upon a showing of probable cause before accessing the privately held data and communications.⁴⁶² Also, courts should revisit the “third-party doctrine,”⁴⁶³ which holds that individuals sacrifice their Fourth

Amendment interest in their personal information when they divulge it to a third party, even if that party has promised to safeguard that data.⁴⁶⁴ Other bolstered Fourth Amendment constraints on national security and law enforcement powers are also essential.⁴⁶⁵ Again, because governments have unique powers and responsibilities, they qualify for a different level of legal scrutiny.

VII. CONCLUSION

[163] The privacy and security-related challenges associated with IoT and wearable technologies will be considerable, but it is essential that experimentation and innovation in this space not be derailed on the basis of speculation about hypothetical worst-case scenarios. Profound benefits will be associated with these new technologies, but those benefits may not come about if preemptive, precautionary policy interventions limit new innovation opportunities.

[164] Nevertheless, the public should not turn a blind eye to the challenges raised by these new developments, because “the Internet of things is not only a technological revolution, but also social revolution.”⁴⁶⁶

As these technologies become (sometimes literally) woven into the fabric of consumers' lives, they will spawn social disruptions that deserve careful consideration and constructive solutions.⁴⁶⁷ This paper has offered a framework for accomplishing that goal without derailing innovative efforts that could yield countless life-enriching applications and opportunities.

[165] To the extent that some public policy responses are needed to guide technological developments, simple legal principles are greatly preferable to technology-specific, micromanaged regulatory regimes. *Ex ante* (preemptive and precautionary) regulation is often highly inefficient, even to the extent of being dangerous. Prospective regulation based on speculation about future harms that may never materialize is likely to come at the expense of innovation and growth opportunities. When corrective actions are needed to address more serious harms, *ex post* measures—especially via common-law actions and FTC enforcement activities—will generally be more sensible.

[166] Using such a balanced, layered approach to privacy and security concerns will ensure that those important values can be protected without derailing the many beneficial forms of economic and social innovation that could flow from IoT and wearable technologies.
